16960. **POEL, J. Van der. Bemestingsproeven met tabak in 1928; benevens eenige beschouwingen omtrent groenbemesters. [Fertilizer experiments with tobacco in 1928 with some considerations on the effect of green manures.]** *Mededeel. Deli Proefstat. Medan-Sumatra Ser.* 2. 66: 1-45. 1930.—The quantity of (1) sulphate of ammonia, (2) double superphosphate and (3) sulphate of potash, which should be applied per plant (in planting 12,000 plants to an acre) was determined by field experiments. The best applications per plant were resp. 3-5 gm. of (1), 4-5 gm. of (2), and 1-2½ gm. of (3), depending on soil type. On some soils 18 gm. of Thomas slag, in addition to the superphosphate, was beneficial. Results were judged by length of leaves and market quality. *Mimosa invisa* and *Crotalaria anagyroïdes,* used as green manure before Deli tobacco, were sometimes beneficial. In other cases a very unfavorable effect resulted, especially from *Crotalaria,* when the tobacco was planted about 2 months after cutting and forking in the legumes. When the unfavorable effect occurs, it shows in a poor development in both nursery beds and field tobacco. The leaves, especially the lower ones, were shorter than on plants grown after a fallow with secondary jungle as is common practice in Deli. The quality of the cured leaves is little affected.—*Author's summary.*

16961. **PRINCE, A. L., and A. W. BLAIR. Soil and crop studies with ammonium sulfate.** *Soil Sci.* 29(4): 267-278. 3 pl. 1930.—Pot experiments were conducted on 3 types of soil using normal and excessive amounts of $(NH_4)_2SO_4$. Up to 1,800 lb. per acre on a heavy silt loam there was no injurious effect on barley or rape but a gradual increase in the crop yield and in the percentage of N in the dry matter. Nitrogen in barley was increased up to 3%; and in rape, up to 4%. On sassafras sand, increasing the $(NH_4)_2SO_4$ beyond 350 lb. per acre produced marked crop injury. One month after $(NH_4)_2SO_4$ was applied the pH had not changed more than 0.6 for the highest rate of application, either on loam or sand. After 10 months there was a change in pH of 1.3 for the highest rate of application on the loam soil. The changes in the sassafras sandy loam were not so great. There was a distinct correlation between the amount of "active" Al in the treated soils and their pH values. The formation of Al sulphate through base exchange reactions and the hydrolysis of this salt are thought to account for the decrease in pH of the soil.—*From authors' summary.*

16962. **REMY, TH. (with the cooperation of A. W. ULRICH). Handbuch des Kartoffelbaues. [Manual of potato culture.]** 2nd rev. and enlarged ed. 309p. 87 fig. Paul Parey: Berlin, 1928. Pr. 13 M.

16963. **REMY, TH., and H. HAASTERT. Saatzeitversuche.** *Landwirtsch. Jahrb.* 72(2): 175-207. 1930.—Experiments conducted in the Rhine province show that winter wheat, which is generally sown between the early part of October and the middle of February, yielded less when sown after December. Summer grains sown in March gave higher yields of better quality than the April sowing. This difference in yield was more pronounced with oats than with barley, late sown barley being less damaged by the Frit fly than oats. Beets planted during the first half of April gave the highest yield which gradually decreased as the planting time approached the middle of May. This decrease in yield was especially marked during yrs. with dry summer weather.—*I. Remy (transl. by F. F. Halma).*

Savjeta (Fac. Agron. et Forest. Univ. Roy. Yougoslave Zagreb, Mem. Cons. Fac.)* 1919-1929: 513-531. 1929.—12 varieties and selections show desirable quality characters. The variety Serbian Prolific appeared to have the best quality and to be high yielding.—*L. R. Waldron.*

16967. **SPAFFORD, W. J. Subterranean clover. (Trifolium subterraneum.)** *Bull. Dept. Agric. S. Australia* 240. 1-16. 8 fig. 1930.—General account, including culture, handling, uses, pests, etc.

16968. **SPILLMAN, W. J. A new basis for fertilizer experiments.** *Science* 71(1831): 135-136. 1930.—Preliminary note.

16969. **SPRAGUE, HOWARD B. Some water relations of turf plants.** *National Greenkeeper* 5(3): 16-18, 20-28. Portrait. 1931.—The balance between rainfall and evaporation is most favorable for new seedings in the northeastern U. S. A. during the late summer and early fall. Artificial watering of turf is most needed from June to August, but closely cut grass suffers from lack of moisture sooner than grass cut at longer lengths, because of the correlation between height of cut and depth of root system. The effectiveness of increasing organic matter content as a means of improving the capacity of the soil for retention of water available to the plant is shown. The daily water requirement of the turf is estimated at 10-32 gallons per 1000 square ft., but other losses greatly increase the amount of water which must be supplied. Proper fertilization as a means of increasing utilization of soil moisture includes the use of phosphates to improve root development and the sparing use of soluble N fertilizers which stimulate top growth but not root development correspondingly. An abundance of soil moisture stimulates the development of tender foliage which is undesirable on turf for lawns and golf courses. Grass which receives barely enough moisture for slow continued growth is capable of enduring considerable trampling without serious injury.—*H. B. Sprague.*

16970. **STEVENS, O. A. North Dakota weeds.** *North Dakota Agric. Exp. Sta. Bull.* 243. 58p. 59 fig. 1930.—A 2nd revision of Bulletin 162 issued in 1922. The accounts of *Agropyron repens, Sonchus arvensis, Euphorbia esula* and

Convolvulus arvensis especially, have been revised. *Centaurea repens* is added to the list of chief weeds. Distribution maps of *E. esula, C. arvensis,* and *C. repens* are shown. New weeds or weeds of special interest, illustrated and discussed, are *Tragopogon pratensis, Solanum rostratum, Sophia parviflora* (*Sisymbrium sophia*), *Erucastrum pollichii, Lolium rigidum, Sisymbrium loeslii, Lepidium draba* and *Linaria vulgaris.*—*O. A. Stevens.*

16971. **STEVENS, O. A. Impurities of North Dakota Bromus inermis seed.** *North Dakota Agric. Exp. Sta. Bull.* 247. 16p. 5 fig. 1931.—General conditions in North Dakota which is considered the center of production of *Bromus inermis* seed are reviewed. A list is given of foreign seeds found in 1849 samples examined from 1909 to 1929. The distinguishing characters of *Agropyron repens, A. smithii* and *A. tenerum* are presented, together with notes on the distribution of a number of other plants. Illustrations of the following seeds, regarded as characteristic, are given: *Agrostis hyemalis, Anemone canadensis, Brauneria angustifolia, Carex festucacea, C. trichocarpa, Cirsium undulatum, Elymus canadensis, Erysimum asperum, E. parviflorum, Gaura coccinea, Hosackia americana, Lactuca pulchella, Lappula occidentalis, Plantago purshii, Poa palustris, Ratibida columnaris, Stachys palustris, Stipa viridula, Symphoricarpos occidentalis* and *Teucrium occidentale.*—*O. A. Stevens.*

16972. **STOUTAMIRE, RALPH. Tobacco growing in Florida.** *Dept. Agric. Florida Bull.* 40. 5-40. 22 fig. 1930.

16973. **STRANSKI, I. Effect of preceding crop on the quality of wheat.** *Ann. Univ. Sofia, Fac. Agric.* 7: 1-16. 1929.—The author examined numerous samples of wheat from the Plevna district to establish the effect of the preceding crop on the following properties of the wheat grain: Absolute and hectoliter weight, impurities, germination power and agricultural value. Vetch gives best results, followed by corn, wheat and fallow land. —*I. Kovachevsky.*

16974. **SYLVÉN, NILS. Avverkningsförsök i blåluzern.** [English summary.] **[Time of cutting experiments with lucerne.]** *Sveriges Utsädesför. Tidskr.* 41(1): 9-57. 1931.—The later the last cutting in the autumn the better will be the overwintering and the better the yield the following year. This depends mainly upon the fact that when the last harvest is taken late there is no chance for the winter-buds to develop new shoots before the winter sets in. The results are supported by refrigeration experiments and by data from Danish experiments. Preliminary results with sweet clover parallel those obtained with lucerne.—*G. Nilsson-Leissner.*

16975. **THROCKMORTON, R. I. The use of commercial fertilizers in Kansas.** *Rept. Kansas State Board Agric.* 50(197): 40-49. 1931.—Experiments show an average increase of 4.5 bu. of wheat per acre or 27% over a period of 19 yr. from use of phosphorus. The best rate of application is about 100 lb. of bone meal, 125 to 150 lb. of superphosphate or a 4-12-0 mixture per acre. The increase for alfalfa is about ½-1 ton per acre. For a new stand of alfalfa, superphosphate should be applied just previous to or at the time of seeding, at the rate of 150 lb. per acre. Similar results were secured with clover. Commercial fertilizers cannot be used successfully in central and western Kansas.

16976. **TOBLER, FRIEDRICH. Sisal und andere Agavefasern. [Sisal, and other Agave fibers.]** (*Wohltmann-Bücher Bd.* 10.) 104p. 44 fig. Deutscher Auslandverlag Walter Bangert: Berlin-Charlottenburg und Leipzig, 1931.

16977. **TORSSELL, ROBERT. Resultat av försök med olika rödklöverstammar vid Sveriges Utsädesförenings filial å Ultuna 1918-1929. [Trials with various red clover strains in 1918-1929 at the Svalöf Branch Station in Ultuna.]** *Sveriges Utsädesför. Tidskr.* 41(3): 127-168. 1931.—The yield, winterhardiness, and regenerative power of red clover strains are reported. Broad leaved red clover is not adapted to the climate and the purebred Swedish strains did not prove as good as old local strains from the vicinity.—*G. Nilsson-Leissner.*

16978. **TRAUB, H. P., and C. E. STEINBAUER. The effect of height of ground water-table on the development of truck crops on peat land.** *Proc. Amer. Soc. Hort. Sci.* 1927: 49-53. 2 fig. 1927.—Onions from seed do best where the level of ground water is 1½-3 ft. below the surface. Head lettuce, cabbage, cauliflower, summer radish, carrot, spinach, sweet corn, girasole, tomato and green beans do best 2-3 ft. above the water table; potato and peas, 2-4 ft.; winter radish, 3-4 ft.; and turnip, 4-5 ft. For the few truck crops analyzed, including the potato, there is little difference in composition, on the green basis, with different ground water-tables.—*A. K. Anderson.*

16980. **VENKATARAMAN, K. Storage experiments with paddy seeds.** *Madras Agric. Dept. Year Book* 1929: 29-35. 1930.—The pressure to which rice seed in the lowermost bag of a pile is subjected does not impair germinating capacity. Similarly, in a pattarai, the enormous pressure to which the bottom-layer is subjected does not affect seed vitality. Seed thoroughly dried in the sun before storage shows a slight increase in weight when stored under shade due to the gradual adsorption of moisture.

16981. **WADSWORTH, H. A. Some observations upon the wilting coefficient of Kunia soil as determined by the pineapple in the balancing system of Briggs and Shantz.** *Pineapple News* 4(3): 37-43. 1 fig. 1930.—The balancing system suggested by Briggs and Shantz for the determination of the wilting coefficient of soils carrying plants with water storage tissue seems to be of no value when the pineapple is the plant used. With the pineapple, the rates of loss (or the moments) from the soil end, and plant end, seemed equal long after the wilting coefficient had been passed. A distinct change in rate of loss of gross weight of the system was noted, however, at a rather definite weight, and if this loss is assumed to be a measure of transpiration it is evident that there is some moisture content which marks the lower limit of equally available soil moisture. The percentage of residual soil moisture corresponding to this change of rate is rather close to wilting coefficient for Kunia soil as determined by other methods. If the period subsequent to the change in rate of loss is characterized by loss of turgidity of the leaves it is probable that growth ceases at or near this point. No growth measurements were made during the study reported. A cessation of growth at this point would identify the corresponding moisture content as the wilting coefficient. The pineapple showed the remarkably low water requirement of 9.5 gm. of water per gm. of oven-dry matter. —*Author's conclusions.*

16982. **WEIGERT, J., und E. HILTNER. Ein Beitrag zur Frage des Kalibedarfs von Gräsern und Leguminosen.** *Ernähr. Pflanze* 26(8): 172-175. 2 fig. 1930.—Ammonia and potash, potash and phosphoric acid, ammonia and phosphoric acid, and complete fertilizer were used on clover and grasses grown in pure cultures and in mixture. The mixed seedings generally yielded considerably more than the single seedings, and the increase included both grasses and legumes. The grasses in pure culture gave the lowest yields where N was lacking in the fertilizer. They also suffered rather seriously when phosphoric acid was omitted. Clover yields were reduced to a very low point when potash was omitted. In 1928 beets were grown on the land without further fertilizer treatment. The beets yielded comparatively well in all cases after both the grass and the clover, except on unfertilized plots and on plots where potash had not been used previously. The yield of beets, however, was very much smaller after clover with no potash than after grass grown without potash. The plots receiving ammonia and phosphoric acid but no potash yielded less than the check plots after both grass and clover.—*J. H. Barron.*

16983. **WHITE, R. G. Rotations of crops.** 2nd ed. 22p.

6 maps. Misc. Publ. 45. Ministry of Agric. & Fisheries: London, 1929. Price 4d.—Discusses factors determining rotations and lists suggestions.—*L. R. Waldron.*

16984. **WISHART, J., and H. G. HINES. Fertilizer trials on the ordinary farm.** *Jour. Min. Agric.* [*Gt. Britain*] 36(6): 524-532. 1929.—Field experiments of the replicated and randomized type initiated at the Rothamsted Experimental Station were successfully carried out on ordinary farms with a minimum of skilled assistance. Basic slag improved the yield of swedes and new meadow hay, even in the year of application, and the effect persisted after 3 yr. without further application. Superphosphate and sulphate of ammonia greatly increased the yield of potatoes, while varying nitrogenous dressings applied at time of sowing improved the yield of sugar beets.—*J. Wishart.*

16985. **WOODMAN, R. M., and W. J. WILEY. The eradication of prickly-pear by chemicals with particular reference to emulsions in the systems phenols-gelatin-aqueous arsenic acid.** *Chem. & Indust.* 50(22): 187T-189T. 1931.—From experiments the authors conclude that for eradicating prickly-pear, spray emulsions containing aqueous arsenic acid solutions and the cresols as liquid phases, with gelatin or glue as the emulsifier, should preferably be of the aqueous arsenic acid-in-cresols type. The arsenic acid present favors this desirable type, and tendencies to form the opposite type in the absence of this acid is suppressed.—*Authors' summary.*

16986. **ZAITSCHEK, ARTHUR. Sudan grass: its cultivation and food value.** *Internat. Rev. Agric. Pt. 1. Mo. Bull. Agric. Sci. and Pract.* 21(9): 321-325. 1930.—Sudan grass is of importance as a fodder crop particularly because of its short growing period, drought resistance, high yield, fodder qualities, and capacity for vigorous growth after cutting. Data from chemical and feeding experiments are given.

16987. **[ZHUKOVSKIĬ, P. M.]** ЖУКОВСКИЙ, П. М. Дикорастущая новая форма ржи из Анатолии и предварительные критические заметки о виде Secale cereale L. [A new wild-growing form of rye in Anatolia. Preliminary critical remarks about S. cereale.] [English summary.] Труды по Прикладной Ботанике, Генетике и Селекции (*Bull. Appl. Bot. Genet. and Plant-Breed.*) 19(2): 49-58. 6 fig. 1928.—A new subspecies of rye with a brittle rachis causing complete articulation at maturity was found by Vavilov (1924) in Afghanistan, where it occurred as a weed in fields of wheat and barley. The author found (1926-1927) forms of wild rye with a brittle rachis in the valley and on adjacent slopes of the Meander (Lydia). This wild polymorphous rye possesses strong straw and is of gigantic size. Many forms show thick pubescence on the external flowering glumes, a rare occurrence in rye. It differs from cultivated forms in its brittle rachis, small flattened grain with white apical brush hairs, broad empty glumes, and pubescent leaf-sheaths of young plants. It is distinguished from the Afghan form by its excessive size, pubescence of leaf-sheath, adhesion of the flowering glumes to the grain, smaller size and flatness of the kernels, hairy brush, and winter habit. The many forms of rye, according to the author, should be placed in 3 subspecies: (1) those with a brittle rachis, (2) those with a tough rachis, and (3) those with intermediate degrees of brittleness of rachis.—*W. W. Mackie.*

16988. **ZIELSTORFF, W., und K. NEHRING. Zur Frage der physiologischen Reaktion der Kalisalze.** *Zeitschr. Pflanzenernähr. Düng. u. Bodenk. A. Wissensch. Teil.* 17(1/2): 67-79. 1930.—From studies of the physiological reactions of different K salts which were tested in 3 different soils, it was found that 40% of K salts like kainite had no effect in changing the reaction of the soil, but that K-Mg sulphate acidified it slightly. In the field experiments there was no effect on the soil reaction. Hence, the various K salts must be regarded as physiologically neutral fertilizers with the exception of K-Mg sulphate.—*Authors' summary* (*transl. by C. J. Lyon*).

16989. **ANONYMOUS. De Landbouwkundige afdeeling van het "Fourth Pacific Science Congress" Bandoeng, 20-25 Mei 1929. (The agricultural division of the Fourth Pacific Science Congress, Bandoeng, 1929.)** [With English summary.] *Landbouw* 5(2): 101-222. 1929.—This account gives only an impression of the important problems discussed. The complete proceedings are to be published later by the Executive Committee. Papers given are briefly reviewed under subject groups indicated below. Rice technical problems of the Pacific area are summarized as follows: Cultivation problems, reviewed by **A. WULFF,** include irrigation, drainage, manuring, and studies on the relation of irrigation-water temp. to growth and yield. The more important insect pests of the rice crop in the area, reviewed by **P. van der GOOT,** include *Chilo simplex, Schoenobius incertellus, Nephotettix* sp. and *Leptocorisa acuta.* Diseases of the rice crop in the Dutch East Indies, Japan, and the U. S. A., are reviewed by **H. F. WATERSCHOOT.** Diseases due to fungi are the most serious in Japan, especially *Piricularia grisea, Helminthosporium oryzae* and *Hypochnus sasakii.* Selection of permanent crops is reviewed by **F. W. OSTENDORF** and others, who discuss the seminal and vegetative selection of rubber, coffee, coconut and oil palm trees. Soil survey and soil research is reviewed by **J. A. van BEUKERING,** this discussion including erosion, classification and mapping of soils. Co-operation in biological insect pest control is reviewed by **S. LEEFMANS;** and forestry problems, by **A. THORENAAR.**

16997. **CRANDALL, F. K., and T. E. ODLAND.** The amount of manure necessary for vegetable growing. II. *Rhode Island Agric. Exp. Sta. Bull.* 225. 1-31. 1930.—This reports the results obtained in 2 market garden rotations at the R. I. Exp. Station from 1923 to 1928, with summaries of results obtained in previous years. The largest yields of early beets and spinach were secured with 16 tons of manure and 1500 lb. of 5-12-4 fertilizer used in rotation Q where a green-manure crop is grown once in 3 yr. With these crops 8 tons of manure in the green-manure rotation maintained yields almost as well as 16 tons without the green manure. Eggplants produced the largest yields of marketable fruits with 32 tons of manure and 1500 lb. of a 4-12-3 fertilizer. On the green-manure rotation with 16 tons of manure and 1500 lb. of 5-12-4 fertilizer the average yield was slightly less. Cauliflower has not been very successful in this rotation where it is grown as a late summer crop following early beets. Commercial fertilizer may be substituted for a large part of the stable manure usually applied for this crop. Carrots, following spinach, showed relatively little difference in yield whether 8, 16, or 32 tons of manure had been applied to the preceding crop. Increasing the manure from 8 to 16 tons in the green-manure rotation increased the yield of early beets 11%, eggplant 35%, and early spinach 34%. The yields of early beets and spinach were increased only 4 and 9% respectively by changing the fertilizer from 4-12-3 to 6-12-3. Reducing the nitrogen by one half in the first ratio, decreased the yields by 17 and 31% respectively for these 2 crops. Eggplants and cauliflower responded markedly to increases in N in the fertilizer, but carrots were but little affected. Spinach and cauliflower showed the greatest increases in yield where the proportion of P was increased by 50%. The experiments demonstrate that it is possible to substitute green manure and commercial fertilizer for a considerable part of the stable manure customarily applied to these crops, with improvement of yield and profits.—*T. E. Odland.*

16998. **DORSETT, R. H.** Persimmon, Diospyros kaki, processing and storage. *Peking Soc. Nat. Hist. Bull.* 5 (4) : 27-28. 1931.

16999. **DORSEY, M. J., and R. L. McMUNN.** Relation of the time of thinning peaches to the growth of fruit and tree. *Proc. Amer. Soc. Hort. Sci.* 24: 221-228. 1927.

17000. **ERWIN, A. T.** Nativity of the cucurbits. *Bot. Gaz.* 91 (1) : 105-108. 3 fig. 1931.—Archeological evidence, much of it obtained in late yrs., proves the existence of *Curcurbita pepo* and *C. moschata* in No. America in early times. Fragments of *C. moschata* are believed to date back to the basket-baker period. Seeds are preserved, as well as a pottery vessel (So. American) modeled after a pumpkin. *C. maxima* is not represented in these collections.

17001. **FREE, MONTAGUE.** The rock garden of the Brooklyn Botanic Garden. *Brooklyn Bot. Gard. Rec.* 20 (3) : 187-241. 28 fig. 1931.—This paper contains lists of saxatile plants "easy to grow" and "fairly easy to grow" and a flowering calendar for the climate of Brooklyn.—*C. S. Gager.*

17002. **GRAAN, L. R. van.** The effect of early defoliation of vegetable plants on subsequent growth and production. *Proc. Amer. Soc. Hort. Sci.* 26: 109-113. 1929 (1930).—In the field defoliation produced no benefits in tomato, and tended to retard maturity. Defoliation of celery resulted in increased yield, particularly of heavily pruned plants. No increase was induced in cabbage, but earliness was increased 18% by defoliation. In the greenhouse root replacement was more rapid in unpruned tomato and cabbage plants, whereas in heavily pruned celery plants the increase was more rapid than in unpruned. Pruned tomato plants, wilted in transplanting, recovered more rapidly than unpruned and bore a larger yield of fruit. The transpiration per square inch of leaf surface was less in pruned tomato and cabbage plants than in unpruned plants.—*M. C. Merrill.*

17003. **HABER, E. S.** The effect of number of plants per hill on yields of sweet corn for the cannery. *Proc. Amer. Soc. Hort. Sci.* 24: 37-40. 1927.—With late maturing, large sweet corn varieties the size or weight of the ear decreased as the number of plants per hill increased; the number of ears per stalk decreased (or the percentage of barren stalks increased) as the number of plants per hill increased; the largest yields are generally secured where there are 4 plants per hill; the greater the number of plants per hill, the greater the yield of fodder. Results with Evergreen for 1 yr. show the check-row method to be far superior to the drilled method of growing this variety, as shown by decrease in size of ear and decrease in total yield of both corn and fodder below that of 7 plants per hill.—*Author's summary.*

17004. **HALL, C. J. J. van.** A review of the more important recent literature on cacao. *Mo. Bull. Agric. Sci. & Pract. [Rome] 22* (4) : 127-132. 1931.

17005. **HARDENBURG, E. V.** Place-effect influence in the Robust pea bean. *Proc. Amer. Soc. Hort. Sci.* 27: 495-497. 1930 (1931).—From the first-year results, there are no marked indications that place-effect (previous environment) in its influence on shape of seed and yield of crop is an important factor in the Michigan Robust variety of pea bean.

17006. **HIGGINS, J. EDGAR.** Annual Report of the Canal Zone plant introduction gardens for 1929. *Canal Zone Exp. Gard. Ann. Rept.* 1929: 1-31. 10 pl. 1930.—The author reports on plant collections in Hawaii and California, including avocado, sugar cane, pineapple, hibiscus, bananas, etc.; and on dissemination of collections to growers including mangos, pineapples, sugar cane, rubber plants and drought-resistant trees.

17007. **HOFFMANN, RALPH, E. O. ORPET, ERIC WALTHER, and JAMES WEST** (compiled and reviewed by). (Ed. by PEARL CHASE.) Cacti and other succulents. An annotated list of plants cultivated in the Santa Barbara Region. 107p. 5 pl. Garden Tours Committee of the Plans and Planting Branch Community Arts Assoc.: 929 Paseo Carrillo, Santa Barbara, Calif., 1930.

17008. **HOOKER, H. D.** Movement of fat in apple shoots. *Proc. Amer. Soc. Hort. Sci.* 24: 185-187. 1927.

17009. **HOSAKA, EDWARD Y.** The culture of the Chinese banana in Hawaii. *Jour. Pan-Pacific Res. Inst. [Honolulu]* 6 (3) : 12-13. 1931.—Introduced into Hawaii in 1855, it has become a very profitable crop, banana culture ranking as the 4th agricultural industry in Hawaii.

17010. **JENYNS, SOAME.** Tea. *Hon Kong Naturalist* 2 (2) : 90-91. 1931.—Studies on the etymology and history of the word suggest that tea was introduced into China during the Chen and Earlier Han dynasties, from the Monsoon regions. Tea was introduced into Europe by the Dutch in the 17th century. Notes on tea culture, trade, and use in China, are given.

17011. **JONES, H. A., and W. W. ROBBINS.** Influence of desiccation and root pruning on performance of asparagus. *Proc. Amer. Soc. Hort. Sci.* 23: 26-28. 1926.—Although crowns survive when subjected to a long period of drying, growth response after planting is slow and the yield of marketable spears is markedly reduced. Yield records during the first 2 yr. of cropping show that the roots should not be pruned before planting. As many of the fleshy roots as possible should be preserved uninjured.

17012. **KAINS, M. G.** Marica as a warm room plant.

Horticulture [Boston] 8(3): 55. 1930.—*Marica* is highly resistant to the heat and dryness of the living room. It is recommended as a pot-plant for indoor flowering.—*C. G. Bowers.*

17013. KIMBALL, D. A. Top working and repair grafting including budding. *Ontario Dept. Agric., Ontario Agric. Coll. Bull.* 357. 1-28. 25 fig. 1931.

17014. KUDO, YAKURŌ. Palms in Formosa. [In Japanese.] *Trop. Hort. [Taihoku]* 1(4): 256-259. 1 fig. 1931.

17015. LOTT, RICHARD V. An important varietal characteristic of the red raspberry. *Proc. Amer. Soc. Hort. Sci.* 27: 139-141. 1930(1931).—Under conditions similar to those of northern Colorado, bud distribution is a varietal characteristic. From this standpoint the most desirable varieties are those with the most buds in the 3rd, 4th, and 5th feet, since this region normally has the greatest yield per bud. Of the 5 varieties studied, June had the most, and Cuthbert the least, desirable bud distribution. Yields do not necessarily follow the same order. The fruiting response from severe cane heading is seldom great enough in Colorado to make up for the large number of buds removed in heading.—*Author's conclusions.*

17024. PROEBSTING, E. L. Concentration of certain constituents of the soil solution under orchard conditions. *Hilgardia* 5(3): 35-59. 1930.—A spring minimum and fall maximum of NO_3 were found. NO_3 had been reduced under alfalfa sod. It was higher in pear plots than in peach plots. SO_4 changes were similar to those for NO_3 except that they were lower under pears than peaches. Carbonates were high in alfalfa sod, tended toward a late summer minimum and to be slightly higher in winter cover crop plots than in checks. Ca showed seasonal curves similar to those of nitrate; it was lower under alfalfa sod. The average Ca concentration increased in a 3-yr. period. Mg was almost identical to Ca in its behavior. K was nearly constant; it was lower under alfalfa. The summation of ions determined showed a slight excess of cations, which was greater in peach plots than in pear, and in alfalfa sod than checks. —*E. L. Proebsting.*

17030. SWINGLE, WALTER T. "Kindzu" or "Golden Bean" orange (Fortunella hindsii) from historic, taxonomic and cytologic standpoints. *Proc. Third Pan-Pacific Sci. Congress, Tokyo* 2: 2001. 1926(1928).—Abstract.

17031. THOMAS, H. H. The amateur's rose book: the cultivation of roses. 284p. Cassel & Co., Ltd.: London, 1930. Pr. 8s. 6d.

17033. TRAUB, HAMILTON P. The lateral root spread of the fig tree. *Proc. Amer. Soc. Hort. Sci.* 27: 109-113. 1 fig. 1930(1931).—The root system is of the fibrous type with long slender laterals; 5-6 yr. old Magnolia fig trees had a root spread of 50 ft.; a single lateral grew over 35 ft. from the main trunk. In fertilizer experiments at least 2 buffer rows between differential treatments appear necessary. Means of preventing root spread over longer distances in trees older than those studied are indicated.

17034. UNWIN, C. W. J. Sweet peas: their history, development, and culture. 2nd ed. 192p. Heffer: Cambridge, 1929. Pr. 2s. 6d.

17035. VINET, E., et M. LEMESLE. Essais sur les engrais appliqués à la vigne. *Prog. Agric. et Vit.* 94(27): 12-18; (28): 38-44. 1930.—Preliminary trials with various amounts of $(NH_4)_2SO_4$, KCl and K_2SO_4 over a 2 yr. period showed responses to both K and N the 2nd year. —*E. L. Proebsting.*

17036. WATZL, JOSÉ. Escolha da variedade Americana para reforma ou nova installação de vinhedo. [Choice of American varieties for planting or replanting vineyards.] *Bol. Agric. [São Paulo]* 30(5/6): 380-393. 1929.—Species recommended as stocks for grafting are: *Vitis riparia, V. rupestris, V. berlandieri, V. cordifolia, V. monticola, V. cinerea* and various hybrids. *V. riparia, V. solonis, V. solonis × riparia,* and *V. riparia × berlandieri* all are good stocks so far as adaptation to climate and culture are concerned. *V. riparia* and *V. cordifolia* are sensitive to lime; *V. berlandieri, V. monticola,* and *V. rupestris × berlandieri* are not. Resistance to phylloxera, from most resistant to least resistant is as follows: *V. rotundifolia, V. rupestris, V. riparia × rupestris, V. riparia, V. berlandieri, V. monticola × riparia, V. cordifolia × rupestris.* Qualities of various varieties of *V. vinifera* as scions are discussed.—*C. D. La Rue.*

FORESTRY

W. N. SPARHAWK, *Editor*

(See also in this issue Entries 15319, 15328, 15353, 15373, 15378, 15550, 15576, 15588, 15591, 16807, 16808, 16810, 16813, 16820, 16989, 17006, 17076, 17132, 17222, 17223)

17041. **BAUER. Die Umstellung der Wirtschaft in den Auewaldungen des badischen Rheintales. [Change of the form of management of the bottomland forests in the Rhine valley of Baden.]** *Forstwiss. Centralbl.* 53(18): 629-643; (19): 682-696; (20): 726-738. 22 fig. 1931.—The mixed hardwood forests on these lands are potentially among the most productive forests in Germany, but now yield little except firewood. In place of the prevailing coppice or coppice-under-standards management, high-forest should be substituted. Contrary to common opinion, this type of forest is not adapted to a selection system, for the principal species (oak, ash, birch, locust, poplar, willow, maple, elm, and alder) are mostly rather intolerant of shade. Formation of even-aged stands is recommended, with an understory of tolerant species to help prune the main crop and keep down grass and underbrush. Methods of handling the various types of stands are described.—*W. N. Sparhawk.*

17042. **BERTOG, HERMANN. Die Akazie in Nordostdeutschland.** *Deutsche Forstzeitg.* 46(45): 1051-1053. 1931.—*Robinia pseudacacia* has been planted extensively in eastern Germany since the time of Frederick the Great. It thrives in localities where apples, pears, and grapes do well, but not where the growing season is short or the winters excessively cold. It is difficult to establish stands by direct seeding, and great care must be taken to avoid drying of the roots in planting. Locust stands are best reproduced by root-suckers, which are stimulated by removing the stumps and breaking up the roots by plowing. Where it is desired to replace the locust with other species, reproduction can be checked by underplanting with spruce, fir or tolerant hardwoods such as beech or maple several years before cutting the locust, as by pasturing the locust cut-over area with sheep or goats until the sprouts are killed.—*W. N. Sparhawk.*

17044. **BRENEZ, A. Essai de reboisement à Kabinda (Lomani).** *Bull. Agric. Congo Belge* 20(1): 118-125. 1 pl., 1 fig. 1929.—Reforestation of denuded land near Kabinda (Belgian Congo) was commenced in 1920, in order to check soil erosion, to afford protection against strong winds, and to furnish firewood. Ndunga (*Mesopsis eminii*) has been the principal species planted. Planting methods are described.—*W. N. Sparhawk.*

17045. **CANNING, F. Annual progress report of forest administration in the United Provinces 1929-1930.** p. 1-34. 1930.—Fencing *Shorea robusta* forest against deer led to a considerable increase in the natural reproduction of that species. *Swertia* spp. are alternate hosts of *Peridermium corticola,* which causes serious damage to young *Pinus longifolia.*—*M. V. Laurie.*

17046. **CHUARD, ERNEST, et al. Forêts de mon pays.** 183p. Illus. with photographs and 1 col. pl. Delachaux & Niestlé: Neuchatel & Paris, 1930.—This popular work on the trees and forests of Switzerland contains numerous essays and articles on the various phases of forestry, including the wild life of the woods. Its aim is to stimulate an appreciation of nature and of natural resources.

17047. **COVILLE, PERKINS. Improved forest tree seed. A suggested study.** *Jour. Heredity* 20(10): 459-467. 5 fig. 1929.—Discusses the value of studies of the relationship between source of seed and qualities of the trees grown from seed of various origins. Suggestions are made regarding methods and organization of such studies. —*W. N. Sparhawk.*

17048. **CROCE, FRANCISCO M. Explotación del alamo. [Use and exploitation of poplars.]** *Min. Indust. y Obras Públ. Mendoza Bol.* 7. 1-33. 18 fig. [1931].—Classification, culture, diseases, insect pests, and uses are discussed.

17049. **DE WILDEMAN, É. Sur la question forestière en Afrique.** *Bull. Inst. Roy. Col. Belge* I(3): 504-516. 1930.—Taking his text from a work of Lecomte on the woods of Indo-China, the author reviews the data concerning the protection of the forests of Africa. He discusses the reserves created in Congo, the necessity of the forest services and the need for international cooperation based on national understandings.—*É. De Wildeman (transl. by J. Kittredge, Jr.).*

17050. **ELMORE, D. R. (Chairman). Report of Committee 5-2-1- Treatment of car lumber.** *Proc. Amer. Wood Preservers' Assoc.* 26: 96-103. 1930.—Discusses the problems in connection with the uses of treated material in cars, the experience of several railroads to date, and the treatment by commercial plants, railroad plants and packers.—*W. H. Snell.*

17051. **FRIESENDORFF, G. von. Chilenskt skogsbruk. [Chilean forestry.]** *Skogen* 18(17): 403-405. 4 fig. 1931.—About ¼ the area of Chile is forested (150,000-190,000 sq. km.). The northern desert zone lacks forest except for a few plantations of *Eucalyptus.* In the central part, the most important agricultural region, many plantations of exotics have been made, including *Pinus insignis, P. maritima,* which yield saw timber in 12 yrs. when irrigated, *Cupressus macrocarpa,* and especially *Populus nigra* var. *pyramidalis.* The latter is perhaps the most important local wood. In southern Chile the natural forests of *Araucaria imbricata, Libocedrus chilensis, L. tetragona, Nothofagus obliqua, N. procera,* and *Fitzroya patagonica* are still subject to uncontrolled exploitation, resulting in much devastation and waste.—*H. I. Baldwin.*

17052. **ILLE, RUDOLF. Pajádro a mrazové jádro bukových kmenů. [False heart and frost heart of the beech.]** [In Czech and German.] *Věstník Československ. Akad. Zem.* 7(5): 533-536. 1 fig. 1931.—The author considers the frost heart of red beech as an abnormal diffused false (red) heart which resulted from an interruption of the development of the trees during the severe winters of 1928-1929. The origin of the usual false or red heart he tried to explain on physiological grounds. This it not the same as the heart rot caused by fungi.—*S. P. Nichols (from abstract by R. Ille).*

17053. **JUNACK. Beruht die Starkastigkeit mancher Kiefern in der norddeutschen Tiefebene auf Veranlagung oder Reizwirkung?** *Deutsche Forstzeitg.* 46(49): 1131-1134. 4 fig. 1931.—In practically every pine stand some of the trees grow faster than the others and develop a more or less bushy form with large limbs. This appears to be due to individual differences in ability to utilize the soil moisture, and is not hereditary. It is a mistake to cut out these individuals which utilize the productive capacity of the site most effectively. They should be retained as long as they maintain their dominance, unless they are decidedly crooked or otherwise poorly formed.—*W. N. Sparhawk.*

17054. **KINDS, R. L'introduction au Congo Belge du "Phytelephas macrocarpa." (Noix de corozo.)** *Bull. Agric. Congo Belge* 21(4): 1294-1295. 1930.—Nuts of *Phytelephas macrocarpa* (the source of vegetable ivory) collected in Colombia, and plants raised in Belgium from similar nuts were planted in Belgian Congo between 1923 and 1928.

17055. **KOLOWRAT, EDWARD. Die Übungen in den neuen Lehrforsten der Hochschule für Bodenkultur.** *Wiener Allg. Forst- u. Jagdzeitg.* 49(26): 157-158. 1931.—Description of an 800 ha. tract, the compartments of Nasswald and Bleibüche, near Vienna, now available as a demonstration forest.—*F. S. Baker.*

17056. **MOKRÝ, THEODOR. Die Böhmerwaldlärche.** *Wiener Allg. Forst- u. Jagdzeitg.* 49(36): 217-218; (37):

224-225. 1931.—An historical study of the natural and artificial distribution, dendrology, silviculture, and utilization of the larch in the Bohemia forest.—*F. S. Baker.*

17057. **PAMPERL, FRANZ.** Literaturstudien über die Forsteinrichtung im Niederwalde. *Wiener Allg. Forst- u. Jagdzeitg.* 49(39): 235-236; (40): 242-243; (41): 248-249. 1931.—Citations, résumés and quotations from German authors of the past 100 yrs. on the subject of formal management and regulation in coppice forests.—*F. S. Baker.*

17058. **PODHORSKY, I.** Adventiv-Wurzelbildung bei Fichte. *Wiener Allg. Forst- u. Jagdzeitg.* 49(31): 189. 2 pl. 1931.—As a rule spruces are killed whenever a deep layer of earth is deposited around the stem. Occasionally, however, a new system of shallow adventitious roots develops and the tree lives. The new roots appear to serve for aeration mainly as the older deep-seated roots remain functional.—*F. S. Baker.*

17059. **PUSTER, Abstands- oder Englische Durchforstung?** *Forstwiss. Centralbl.* 53(21): 754-760. 1931.—The method of thinning formerly advocated by Weinkauff involved selection and marking of 200 "U-trees" per ha. to stand through the rotation, together with 200 substitute trees to take care of accidents to the "U-trees." All other trees competing with the roots or crowns of these were to be taken out in thinnings beginning at 60 years. Recent modifications have brought this method close to the so-called English thinning, which begins earlier, does not definitely select the reserve trees, maintains a more closed canopy as well as understory trees, and ends the rotation with about 330 dominant trees per ha.—*W. N. Sparhawk.*

17060. **THURSTON, EDGAR.** British and foreign trees and shrubs in Cornwall. xi+288p. University Press: Cambridge, 1930. Pr. 12s. 6d.

17061. **WALRAVENS, EUGÈNE.** Plantation du Chlorophora excelsa. *Bull. Agric. Congo Belge* 21(4): 1442-1444. 1930.—The advantages of *C. excelsa* as a tree for planting in the vast treeless areas of central Africa are stressed. The wood is termite-resistant, not difficult to work; tree growth is fairly rapid; it grows well in sandy soil, in hilly regions; and it resists prolonged drought and cool nights.

17062. **WILSON, T. R. C., T. A. CARLSON, and R. F. LUXFORD.** The effect of partial seasoning on the strength of wood. *Proc. Amer. Wood Preservers' Assoc.* 26: 349-378. 18 fig. 1930.—Tests on tamarack, chestnut, loblolly and shortleaf pines and Douglas fir showed that: (1) strength values are definitely related to moisture content (below the fiber saturation point) if the moisture is evenly distributed throughout the wood; (2) the above mentioned relationships are not applicable to wood air-seasoned for several months or artificially seasoned as in connection with preservative treatment, where the moisture is not evenly distributed. It is concluded that there is no hope of deriving formulae applicable to partially seasoned timber.—*W. H. Snell.*

PHARMACOGNOSY AND PHARMACEUTICAL BOTANY

HEBER W. YOUNGKEN, *Editor*

A. 6(4): Entries 9287, 9539, 10163, 10181, 10183, 10184, 10236, 10283, 10285, 10295, 10456, 10959, 10962, 10976, 10982, 11044, 11178, 11210, 11872; 6(5): 12172, 12795, 12818, 12819, 12820, 12990, 13082, 13241, 13300, 13356, 14016; and in this issue 15161, 15517, 15520, 15521, 15524, 15547, 15548, 15551, 16029, 16075, 16210, 16216, 16258, 16639, 16858, 16886, 17183)

17063. **BECKER, MAX.** Über Insektenwachse. IV. Über Coccerin, das Wachs der Cochenille-Schildlaus (Coccus cati). [Coccerin, the wax of the cochineal insect.] *Biochem. Zeitschr.* 239(1/3): 235-242. 1931.—Chemical study.

17064. **CAVARA, F., e A. CHISTONI.** Sul contenuto in morfina dell'oppio di alcuni ibridi di Papaver somniferum L. (Morphine content of Papaver hybrids.] *Rend. Accad. Sci. Fis. e Mat. Cl. Soc. R. Napoli* 35(1/4): 31-34. 1929.—The hybrid *album* × *nigrum* yielded from 7.12% to 14.4% of morphine.

17065. **CRAVERI CALISTRO.** Les essences naturelles: extraction, characters, emplois. Transl. from the 2nd Italian ed. by HENRI TATU. xi+602p., 57 fig. Dunod: Paris, 1929. Price, 70 fr.—The first part of the book is devoted to the chemistry of the constituents of volatile oils. Next, methods of preparation (distillation, enfleurage, extraction with selective solvents) receive consideration. The major portion of the book is devoted to brief monographs of a number of volatile oils, arranged botanically according to the plants from which they are derived.

17066. **ESDAILE, PHILIPPA C.** Economic biology for students of social science. Part II. Animal and vegetable products. 231p. 96 fig. Univ. of London Press: London, 1931. Price 10s. 6d.—This work deals only with those animal and vegetable products which are connected with household science, and with products rather than with foods as such. Leather, parchment, and vellum; furs; hair and wool; horn, ivory, and whalebone; bone; glue, isinglass, and catgut; fats, waxes, and oils; milk and milk products, are treated from the standpoints of origin and structure, and of the relations of these to their uses. The vegetable products discussed are the vegetable dyes; fatty products including oils and fats; the gums, resins, and vegetable isinglass; fibers; carbohydrates, including starches, sugars, and cellulose; trees, timber, and tree products such as cork, rubber, gutta-percha, and balata; beverages; vinegar; and flavorings, spices, herbs, and condiments. A glossary of technical terms is added.—*C. A. Kofoid.*

17067. **FENTON, E. WYLLIE, and E. D. S. ROBERTSON.** Poisonous and milk-tainting plants and symptoms and first aid to stock. *Edinburgh & East Scotland Coll. Agric. Bull.* 4. 1-56. 1931.—This bulletin describes all poisonous and milk-tainting plants which occur in Scotland. The descriptions are short and popular. Symptoms, preventive measures and treatments of poisoned stock are briefly discussed. Water dropwort (*Oenanthe crocata, Umbelliferae*) causes more poisoning than any other plant.—*H. C. Hanson.*

17068. **GOESTER, L. E.** Pharmacognostische Opstellen, 5. Variabiliteit, erfelykheid en selectie. *Pharm. Weekblad* 68(3): 41-59. 1931.—Many medicinal plants show considerable difference from the original form; in several cases the original form is not known with certainty. This is illustrated on some examples (*Papaver somniferum, Linum usitatissimum, Cichorium intybus*). The general causes of variability on plants are discussed. Examples are given (*Hyoscyamus niger, Mentha piperita, Rheum, Piper cubeba, Pyrethrum cinerariaefolium*) to show the great importance of systematic, genetic research in the development of superior forms of medicinal plants.—*L. E. Goester.*

17069. **GRIEBEL, C.** Zur mikroskopischen Pollenanalyse des Honigs. (IV. Mitteilung.) Auslandshonig. *Zeitschr. Untersuch. Lebensmittel* 61(3): 241-306. 150 photomicrographs. 1931.—The treatise gives the description and illustration of the pollen-forms observed in about 120 honeys outside of Germany (chiefly American) and not occurring in German honeys. The technique for the separation of the pollen grains from honey is also described.—*C. Griebel* (*transl. by G. E. Marvin*).

17070. **KRISHANA, S., and T. P. GHOSE.** Indian Ephedras. *Indian Forest Rec.* 16(2): 19-50. 4 pl. 1931.—A suitable method of assay of Ephedras is described.

The alkalisation with ammonia and the action of chloroform are discussed. Ephedras from many localities in India have been assayed. *E. foliata* has no ephedrine. The richest samples of *E. intermedia*, *E. gerardiana* and *E. nebrodensis* assayed 2.33%, 2.15%, and 2.79% of total alkaloids, the percentages of ephedrine being 0.38%, 1.53%, and 1.79% respectively. The ephedrine content is not affected by altitude. The greater the rainfall the lower the percentage of alkaloids. The ephedrine content is lowest in wet months and highest in the autumn. Storage of plants does not affect the alkaloidal content appreciably. A cheap method of large scale extraction with dilute HCl is described, and 2 methods of synthesizing ephedrine are given.—*M. V. Laurie.*

17071. **LOTHROP, R. E., and H. S. PAINE. Diastatic activity of some American honeys.** *Industr. and Engineer. Chem.* 23(1): 71-74. 1931.—In view of objections raised in Germany to the low diastatic activity of various importations of American honey, the diastatic activity of many samples of unheated American honey of a great variety of floral types was made. The natural diastatic activity of most types was sufficiently high to meet the German requirements. Honeys of certain floral types, notably those of darker color, show characteristically high diastase values, whereas a few, among which alfalfa and orange are the best examples, generally show low values. Considerable variation in the diastatic activity of various samples of the same floral type was found. Moderate heating lowers diastatic activity somewhat. The diastase is probably derived from pollen. Its activity is greatly affected by variations in pH, the optimum being about 5.3. Methods for determining diastatic activity of honey in vogue in Germany do not take this factor fully into account. Gothe's method is objectionable in that large differences in pH exist between the contents of the comparison tubes in a given determination. For honeys of medium diastatic activity Gothe's method furnishes fairly satisfactory comparative values, since the pH values of the significant comparison liquids are near the optimum. In the case of very low or very high values, the method does not yield comparable results. A modification of Gothe's procedure is described in which the pH of the various liquids in a comparison series is kept constant at the optimum point for diastatic activity.—*Courtesy Industr. and Engineer. Chem.*

17072. **MAJIMA, RIKŌ. Über die Identität von Japaconitin und Aconitin und über zwei neue Aconitum-Alkaloide.** *Proc. Imp. Acad. [Tokyo]* 5(9): 415-417. 1929. Aconitine was discovered in 1820, but Japanese aconite was not investigated until 1877. The alkaloid of the Japanese aconite was considered different from aconitine, and was given the name of japaconitine. Some investigators, however, considered it identical. The present studies of the chemical constitution of the alkaloid were rendered difficult by the fact that the japaconitine used differed in minor respects from the alkaloid obtained by other investigators. Investigation of the 10 spp. of *Aconitum* found in Japan failed to yield an alkaloid that corresponded exactly with japaconitine. Differences were due not to the existence of various isomers, but to the fact that there were various mixtures of 3 alkaloids, which were finally isolated,—*aconitine* $C_{34}H_{45}NO_{11}$, and 2 new closely related alkaloids, *mesaconitine* $C_{33}H_{45}NO_{11}$ and *hypaconitine* $C_{33}H_{45}NO_{10}$. The name japaconitine has therefore become superfluous. Article concludes with descriptions and method of isolation of each alkaloid.—*C. C. Plitt.*

17073. **PRESCHER, JOHANNES, und ECKART BOHM. Über die Bewertung der Diastaseprobe bei der Beurteilung von Kunsthonig auf Honigzusatz.** *Zeitschr. Untersuch. Lebensmittel* 61(5): 500-508. 1931.—The diastase content of pure honey is not constant. Honey can readily convert 3-5% starch solution to maltose, leaving no dextrin colorable with I. Down to 2% honey solutions, the amounts of starch hydrolysed are to a great extent proportional to the honey concentrations. Artificial honey, glucose, and especially fructose, minimize the hydrolysing effect. A mixture of 10 parts of honey and 90 parts of artificial honey hydrolyses 4 times as weak as a mixture of 10 parts of honey and 90 parts of water. The opinion is advanced that 1 Gm. of artificial honey with 10% honey admixture should hydrolyse 1 cc. of a 0.1% starch solution. The demonstration of diastase in more limited honey admixture is considered uncertain.—*H. Güth (transl. by C. C. Plitt).*

17074. **RAM, KASHI. Studies in Indian oil seeds. (4) The types of Sesamum indicum, D. C.** *Mem. Dept. Agric. India. Bot. Ser.* 18(5): 127-147. 7 pl. (3 col.), 1 fig. 1930.—From observation over a period of 4 yrs., it was concluded that there are 30 types of *Sesamum indicum* DC. A key to these and a description of each are given followed by observations on a sepaloid form, and a conclusion that smooth seeds yield a greater percentage of oil.—*R. D. Bienfang.*

17075. **SCHWARTZ, LOUIS. Dermatitis venenata due to contact with Brazilian walnut wood.** *U. S. Publ. Health Repts.* 46(33): 1938-1943. 1931.—Eleven cases of dermatitis venenata occurred among 100 workmen in a cabinetmaking plant due to contact with *"embuia"* (*Nectandra* sp.), especially in persons exposed to the sawdust. Cases also occurred in 9 out of 10 other plants using the wood. Tolerance is developed as a rule. Patch tests with sawdust from this wood on 3 volunteers showed positive reaction in each case.—*Author's summary.*

17076. **YERSIN, A., et A. LAMBERT. Essais d'acclimatation de l'arbre à quinquina en Indochine.** *Arch. Inst. Pasteur Indochine* No. 8. 5-22. 3 pl. 1928.—Cultivation of *Cinchona ledgeriana* in basaltic soil appears technically possible on the slopes of the Lang-bian massif at an altitude of 1,000 m., as soil quality supersedes climatic conditions, and *C. ledgeriana* can withstand a severe dry season. Selection trials are necessary in order to obtain a good producing type adapted to its new habitat.—*From authors' conclusions (transl.).*

17078. **BOLD, HAROLD C. Life history and cell structure of Chlorococcum infusionum.** *Bull. Torrey Bot. Club* 57(9): 577-604. 5 pl., 5 fig. 1930.—Observations of cultures show that *C. infusionum* (Schrank) Men. is identifiable by the following characters: the aggregation of polyhedric individuals into a loose coenobium which originates during the swarming of the zoospores; mature vegetative cells are 8-30 μ in diam. The wall is composed of an inner, thin, cellulose layer adjacent to the protoplast, and an outer gelatinous layer, which is often thick and lamellate. The chromatophore is parietal, with or without an opening, and often contains numerous droplets of colorless oil; the chromatophore contains 1 or occasionally 2 angular or spherical pyrenoids. The cells are uninucleate, becoming multinucleate only immediately preceding cleavage. Multiplication is by formation of biciliate zoospores and non-motile aplanospores, both arising by progressive cleavage of a mother protoplast into uninucleate segments. The pyrenoid of the mother cell fragments during cleavage, each daughter protoplast receiving a fragment which becomes a pyrenoid; there is no evidence for an origin de novo of the pyrenoid. Zoospores and aplanospores increase in size

to form the vegetative cells. There is no increase in number of individuals by cell bipartition. Gamete fusion has not been observed. Apparently it does not occur in nature or else conditions in artificial culture are an impediment to fusion. Multiplication is by zoospore formation as long as the moisture is sufficient to permit their escape from the zoosporangium. In dry cultures the potential zoospores develop thick gelatinous membranes and begin their development without a motile stage. In solutions of lower concentration than 1.8%, zoospore formation proceeds rapidly; in nutrient solutions of greater concentration multiplication is by aplanospores. Slight changes in temp. cause liberation of zoospores. The pyrenoid is associated with starch formation. Segments are separated from the protein core, dissolve, and are deposited in the form of starch in the cytoplasm surrounding the pyrenoid. It is suggested that the chemical view of certain proteins as complex molecules which have carbohydrate side chains may be the basis of the morphological changes taking place in the pyrenoid during starch formation. The so called "stroma starch" is in the form of minute ellipsoidal grains which are cleft off from the starch ring surrounding the pyrenoid, and migrate radially through the chromatophore.—*Author's summary.*

17079. **BROWN, HELEN JEAN. The desmids of the Southeastern coastal plain region of United States.** *Trans. Amer. Microsc. Soc.* 49(2): 97-139. 4 pl. 1930.—The 1st part of the paper discusses the distribution of desmids from the geographical aspect and the underlying rock strata; the distribution suggests that slightly acid waters are more important than temp. or underlying geologic formations in limiting desmid occurrence and distribution. The 2nd part consists of an annotated list of the 238 spp. (46 new for the U. S. A.) found in the collections, including: *Pleurotaenium maximum* var. **tumidum*** (p. 108) and *Micrasterias truncata* var. **major** (p. 115), both from New York.—*H. J. Brown.*

17080. **LAING, ROBERT M., and H. W. GOURLAY. The New Zealand species of Gigartina. Part II (Foliose forms).** *Trans. & Proc. New Zealand Inst.* 62(2): 134-155. 4 pl., 15 fig. 1931.—A review of species known or reported from New Zealand, with descriptive, taxonomic, and distributional notes. It includes a considerable number of species excludendae. A key to the species is given.

17081. **LAMBERT, F. D. On the structure and development of Prasinocladus.** *Zeitschr. Bot.* 23: 227-244. 4 fig. 1930.—*Prasinocladus* from an aquarium at Naples was found to be in the *"lubricus"* growth form (Zimmermann). Details of structure and growth are given. Growth in length as well as in branching is brought about by a reproductive process in which the cell divides longitudinally, and one zoospore so formed slips past the other. Instead of escaping, this may remain attached in the cell-opening and from its new position take part in further growth. In general form and habit *Prasinocladus* shows a superficial resemblance to several other algae.—*I. F. Lewis.*

17082. **LEMOINE, Mme. PAUL. Les Corallinacées de l'Archipel des Galapagos et du Golfe de Panama.** *Arch. Mus. Hist. Nat.* [*Paris*] 4: 37-88. 4 pl., 35 fig. 1929.—The descriptive list includes 14 spp. from 3 islands in the Gulf of Panama, distributed as follows: from the island of Coiba, *Archaeolithothamnium* **howei*** (p. 40), *Mesophyllum australe* vars. *tualensis** Fosl. and *minutula** Fosl., *Lithophyllum* **brachiatum*** (*L. lithophylloides* var. *brachiata* Heyd.) (p. 44), *Lithophyllum* (?) **coibense*** (p. 45), and *Melobesia* (*Litholepis*) **fertilis*** (p. 49); from Gorgona, *Lithothamnium indicum** var. *subtilis*, *Lithothamnium* sp., *Lithophyllum* sp., and *Amphiroa* **crosslandi*** (p. 50); from Cocos, *Lithophyllum* (?) **lividum*** (p. 46), *L.* (?) *propinquum* var. **cocosica** (p. 46), *L.* (?) *fetum* Fosl., *L.* (*Dermatolithon*) **saxicolum*** (p. 48), and *Porolithon* **cocosicum*** (p. 49). The 24 spp. from the Galapagos Islands are *Archaeolithothamnium* **crosslandi*** (p. 57), *Lithothamnium* **cottoni*** (p. 57), *L.* **pocillum*** (p. 58), *Epilithon galapagense*, *Mesophyllum* **laxum*** (p. 60), *Lithophyllum* **complexum*** (p. 60), *L.* **divaricatum*** (p. 63), *L.* **alternans*** (p. 64), *L. claudescens**, *L. intermedium**, *L. frutescens**, *L.* **sancti-georgei*** (p. 66), *L.* **rileyi*** (p. 68), *L.* (*Derm.*) **tessellatum*** (p. 68), *L.* (*Derm.*) **mutabile** (p. 70), *Tenarea* **erecta*** (p. 70), *Melobesia* (*Litholepis*) *accola* Fosl. (?), *Amphiroa* **van bosseae*** (p. 73), *A.* **polymorpha*** (p. 74), *A.* **dimorpha*** (p. 76), *A.* **compressa*** (p. 75), *A.* **annulata*** (p. 78), and *Arthrocardia* sp. The author remarks upon the endemic character of the corallines of the Galapagos, their non-tropical affinities, and their closer relationships with those of the Antilles than with those of the Pacific.—*M. A. Howe.*

17083. **PAL, B. P. Burmese Charophyta.** *Proc. Linn. Soc. London* 143. 42-43. 1930/1931.—Abstract.

17084. **PETERSEN, JOHS. BOYE. Algae from O. Olufsen's Second Danish Pamir Expedition 1898-1899.** *Dansk Bot. Ark.* 6(6): 1-59. 1 pl. 1930.—The paper treats of a collection of algae from Pamir, its border districts, the provinces Wakhan, Goran, and Shugnan, Ferghana, Transcaspia, and a single sample from Persia. After a short account of the climatic conditions of the area, and a summary of the literature dealing with the algae of Central Asia, follows a list of the samples examined with enumeration of the species found in each. The Halobion system of Kolbe is applied to the diatom floras of the different lakes and provinces, establishing for each a Halobion spectrum. In the waters of Transcaspia and in some of the lakes of Pamir proper a considerable number of the diatoms are mesohalobes and halophilous species. The greater part of the paper is a list of the species with systematical, ecological, and geographical remarks. New forms are: *Phormidium* **paulsenianum*** (p. 23), *Navicula* **paulseniana*** (p. 40), *Cymbella hybrida* var. **pamirica*** (p. 47), *C.* **subsymmetrica*** (p. 47), *Amphora coffaeiformis* var. **transcaspica*** (p. 48), *Nitzschia amphibia* var. **thermalis*** (p. 51), *N. heidenii* var. **pamirensis*** (p. 52). *Navicula tridentula* Krasske (=*N. bidentula* Petersen).—*J. B. Petersen.*

17085. **RICHARDS, HORACE G. Notes on the marine Algae of New Jersey.** *Bartonia* 13. 38-46. 1932.—Following a brief description of the region, summary of previous work by others, and account of methods now used, is an annotated list of the marine Algae of New Jersey as found by the writer from 1928 to 1931.—*F. W. Pennell.*

17086. **WATSON, JEANNETTE B., and JOSEPHINE E. TILDEN. The algal genus Schizomeris and the occurrence of Schizomeris leibleinii Kützing in Minnesota.** *Trans. Amer. Microsc. Soc.* 49(2): 160-167. 1 pl. 1930.—This is a summary of the information relating to the genus. The principal differences between the material collected in Minnesota and that previously described and figured are discussed: (a) the "ring"-like structure, not described in other published accounts, regularly appearing in the transverse walls of the filaments; (b) the great irregularity in the form and arrangement of the cells of multiseriate filaments in contrast with the conventionalized "brick"-like arrangement usually figured.—*J. B. Watson.*

17087. **WESLEY, OPHELIA C. Spermatogenesis in Coleochaete scutata.** *Bot. Gaz.* 89(2): 180-191. 2 pl. 1930.—This alga collected in the Chicago region produced antheridia from about June 15 to Oct. 15. By division of an interior vegetative cell of the thallus, which ordinarily would not divide again, 2 antheridial mother cells are formed. Further division of each of the mother cells produces a small antheridium and a sister cell, the latter dividing similarly as did the mother cell. In this way more than 4 antheridia may be developed from 1 vegetative cell. The wall of the sister cell of the last antheridium formed has the appearance of the outer wall of an ordinary vegetative cell. The antheridia contain either normal chloroplasts, abnormal chloroplasts, or none at all. The antherozoids formed from each of the daughter cells usually escape through a common pore. *C. scutata* is thought to be next to the Charales in complexity of antheridium development.—*L. H. Tiffany.*

(See also in this issue Entries 15177, 15211, 15359, 15395, 15397, 15433, 15434, 15444, 15446, 15465, 15467, 15469, 15525, 15582, 15587, 15598, 15626, 15627, 15628, 16434, 16591, 16671, 16672, 16675, 16811, 16829, 17270)

FUNGI

17088. **BLOCHWITZ, ADALBERT. Standorte und geographische Verbreitung der Schimmelpilze.** *Ann. Mycologici* 28 (3/4) : 241-268. 1930.—The opinion that moulds grow on vegetable, bacteria on animal materials, moulds on acid, bacteria on alkaline substrata, is not entirely correct. All notes on the habitat found in the literature and from the author's observations are tabulated. Some spp. of *Aspergillus* and *Penicillium* endure acid media, or form acids; they are, therefore, not easily antagonized by bacteria. They flourish on moist substrata, and occur in fleshy fruits and vegetables. Oxyphobe spp. are very sensitive to bacteria, and prefer dry substrata; they often occur on excrement, on living or dead insects, on parts of the human or animal body, on cheese, dried fish and other animal materials, on dry fruits, seeds, etc. All spp. have been cultured on acid and alkaline solutions, on pears, apples, bananas, on flesh, dry and moistened cheese and bread. A few spp. are cosmopolitan and common; others have been found in all continents, but are rare. Most spp. of *Aspergillus* are rare, found only once or twice. Several spp. are common in Japan or in Java and neighboring regions, or in America, very rarely in Europe. Methods by which moulds have crossed ocean barriers are discussed. *Aspergillus* spp. are more common in warm countries, *Penicillium* in cold countries.—*A. Blochwitz.*

17089. **BOEDIJN, K. B. Notes on some sooty moulds.** *Bull. Jard. Bot.* [*Buitenzorg*] 11 (2) : 220-231. 1 fig. 1931.—The term "sooty mould" is restricted to those dark-colored fungi which grow on insect secretions, in extra-floral nectaries, etc. Six types of conidial fructification are recognized; buds put out by mycelial cells, as in *Dematium pullulans;* "bodies consisting of a few to rather numerous cells of the same shape and appearance as those of the mycelial threads," here called Coniothecium conidia after the genus of which they are characteristic; and irregular star-shaped conidia as in *Triposporium;* pycnidia with long necks,—the type of fructification united by Zopf under the name *Fumago vagans* Pers.; pycnidia similar to the above, but without long necks; and a type consisting of globose pycnidia on a coarse, *Torula*-like mycelium, here regarded as probably belonging to *Antennularia. Capnodium* **theae*** (p. 223), on leaves of Thea; *C. stysanophorum* Penzig et Sacc. is excluded, as the type specimen consists of 2 unidentified sterile fungi; *Chaetothyrium* **javanicum** (*Capnodium j.* Zimmermann) (p. 225); *Aithaloderma* **setosum** (*Antennaria setosa* Zimm.=*Capnodium guajavae* Bernard,=*A. longisetum* H. and P. Syd.) (p. 227); *Phycopsis* **treubii** (*Atichia t.* v. Höhnel) (p. 228).

17090. **DERX, H. G. Étude sur les Sporobolomycètes.** *Ann. Mycologici* 28 (1/2) : 1-23. 1 pl. 1930.—These fungi, usually encountered by accident, are a part of the microflora which develops on honey-dew and which is nourished principally by sugary exudations produced by green parts of plants as a result of atmospheric or traumatic causes. Consequently, they occur frequently among leaf parasites and often accompany sooty molds. Several spp. are markedly mucilaginous, but this character may disappear in culture. Besides cultural variations of a more or less stable sort, a true mutation was produced by *Sporobolomyces salmoneus. S.* **salmoneus** (p. 17), *S.* **gracilis** (p. 18), *S.* **odorus** (p. 14), and *S.* **albo-rubescens** (p. 14), are described, as are also *S. tenuis* Kl. and v. N., *S. roseus* Kl. and v. N., and *S. salmonicolor* (F. and Br.) Kl. and v. N. Colorless or faintly colored forms are segregated in a genus **BULLERA**, of which 2 spp. are recorded—*B.* **alba** (*S. a.* Hanna) (p. 19), and *B.* **grandispora** (p. 18). The 2 genera are united into the family **SPOROBOLOMYCÈTES** (Sporobolomycetaceae?) (p. 20). A 3rd group of organisms is mentioned under the provisional name **TILLETIOPSIS** (p. 3). These project long, slender, sickle-shaped spores.—*L. R. Tehon.*

17091. **DOWDING, E. SILVER. The sexuality of Ascobolus stercorarius and the transportation of the oidia by mites and flies.** *Ann. Bot.* [*London*] 45 (180) : 621-637. 1 pl., 10 fig. 1931.—The ascospores are unisexual and the fungus is heterothallic. The ascospores and the mycelia which they produce are sexually of 2 kinds: (+) and (−). When 2 (+) mycelia or 2 (−) mycelia are paired, the pairs remain sterile indefinitely; when a (+) mycelium and a (−) mycelium are paired, large numbers of apothecia are soon formed. The oidia are unisexual. A (+) mycelium of ascosporous origin produces (+) oidia and a (−) mycelium of ascosporous origin produces (−) oidia. When horse-dung mites or flies are allowed to crawl from a mycelium of one sex bearing oidia to another mycelium of opposite sex, apothecia are produced in the cultures visited by the mites or flies.—*E. S. Dowding.*

17092. **FLOR, H. H. Indications of heterothallism in Tilletia tritici.** *Phytopath.* 21 (1) : 107. 1931.—Abstract.

17093. **HANNA, W. F., and W. POPP. Relationship of the oat smuts.** *Phytopath.* 21 (1) : 109. 1931.—Abstract.

17094. **HINO, IWAO, and EIRI NAGAOKA. Cintractia machili n. sp., a new smut of Machilus longifolia Blume and M. thunbergii Sieb. et Zucc. var. glaucescens Blume.** *Bull. Miyazaki Coll. Agric. and Forestry* 3. 49-58. 2 pl. 3 fig. 1931.—The fungus was found on diseased winter buds of the 2 hosts, on the Island of Kinshiu. It was earlier mentioned as *Ustilago* sp. in Zyumoku-Byogai-Hen and as *Anthracoidea onumae* Shirae var. nov. (?) in "A list of Japanese fungi."

17095. **HIRATSUKA, NAOHIDE, and HIDEJI KOTANI. Notes on some species of Claviceps collected in Hokkaido, Saghalien and the Kuriles.** [In Japanese.] *Tottori Nagaku-Kwaiho* (*Trans. Tottori Soc. Agric. Sci.*) 2 (1) : 57-60. 1 fig. 1930.

17096. **KARLING, J. S. Studies in the Chytridiales VI. The occurrence and life history of a new species of Cladochytrium in cells of Eriocaulon septangulare.** *Amer. Jour. Bot.* 18 (7) : 526-557. 3 pl. 1931.—*Cladochytrium* **replicatum*** (p. 538) occurs in dying and decaying cells of *Eriocaulon septangulare, E. compressum, Elodea canadensis, Myriophyllum verticillatum, Cladophora glomerata,* and *Spirogyra* sp. collected in New York City and on Long Island. It causes no evident hypertrophy or malformation of the host and appears to be weakly parasitic. Its vegetative thallus consists of a tenuous, branched rhizo-mycelium with one- to several-celled turbinate organs which is replicated to a large extent as it spreads in the host tissue. Intercalary and terminal, spherical, oval, and irregular zoösporangia of variable diameter occur at various intervals on the rhizomycelium. The zoöspores, 4-7 μ in diameter, are discharged through a sporangial neck and lie quiescent in a mass for a few seconds before swimming away. Each zoöspore possesses a single posteriorly attached cilium and a brilliant golden brown globule. The vegetative thallus of the Cladochytriaceae is designated as a rhizomycelium with the view of calling particular attention to its difference from the rhizoidal system of the Rhizidiaceae. Large oval, spherical, and irregular golden zoösporangia which may occupy as many as thirteen host cells and produce hundreds of zoöspores have often been found in cells of *Eriocaulon, Elodea,* and *Myriophyllum.* Resting spores have so far not been found. Whether the forms which occur on the various host plants are the

same species is uncertain, but the evidence at hand suggests that they constitute a single ubiquitous species which parasitizes numerous aquatic plants.—*Author's summary.*

17097. KILLERMANN, SEB. Bayerische Becherpilze. I. Eupezizaceen. Mit kritischen Bemerkungen. *Kryptogam. Forsch. Bayrische Bot. Ges. Erforsch. Heimischen Flora* 2(1): 27-47. 3 pl. 1929.—This work is a report of collections (65 spp.) of Bavarian Eupezizaceae made over a period of 20 yrs. Critical notes deal with spore measurements, hosts, and synonymy for spp. described in century old literature by Rehm and Allescher. Keys to the genera and to the spp. of the larger and more difficult genera are given.—*M. L. Dawson.*

17098. LEONIAN, LEON H., and HERBERT L. GEER. Comparative value of the size of Phytophthora sporangia obtained under standard conditions. *Jour. Agric. Res.* 39(4): 293-311. 1929.—A tabulation of sporangial measurement of 27 spp. of *Phytophthora* (including *Blepharospora*) as reported by various workers supports Leonian's earlier conclusion that the sporangium in the genus is so variable, and so influenced by the substratum or host as to be of little taxonomic value unless taken from cultures grown under standardized conditions and on media of known composition. A large number of strains was assembled, representing 15 known spp. (many strains were unidentified). These were cultured so as to obtain sporangia under standardized conditions (a vigorous growth of sterile mycelium was obtained at 25° C. on a medium consisting of nucleinic acid 1.0 gm., dihydrogen potassium phosphate 0.6 gm., magnesium sulphate 0.3 gm., dextrose 3.6 gm., and distilled water 1000 cc.; after 3 days of growth, the sterile mycelium was removed, washed in dist. water, and transferred to $M/1000$ KNO_3, and cultured at 25° C.); 200 (in some cases 400) sporangia were measured, mean and mode of length and width being recorded. Groupings on the basis of resemblance in sporangial dimensions resulted in putting together spp. or strains which differ greatly in other and more significant characters. Similar measurements of oogonia and of oospores showed these, also, to be unreliable as criteria of species. Relation of antheridia to oogonia is similarly variable, and of little significance taxonomically, as both paragynous and amphigynous antheridia occur in at least 4 spp. (*cactorum, fagi, syringae,* and *pini*). Determination cannot be based on presence or absence of sexual bodies. Cyclical succession of phases in which sex organs are present and phases in which they do not form, occurs in some strains. Dissociation occurs, and the variants may differ greatly in sporangial, oogonial and oospore characters. So-called mutations, saltations, etc., are probably mostly instances of dissociation. The authors summarize their views as to the taxonomy of the genus as follows: *Phytophthora infestans, P. thalictri,* and *P. phaseoli* are taxonomically secure. *P. cinnamomi, P. cryptogea, P. erythroseptica,* and *P. pini* are also distinctive enough to be retained. *P. mexicana* should be merged with *P. erythroseptica* and *P. capsici* with *P. citrophthora. Blepharospora cambivora* should be *Phytophthora cambivora* and *P. fagi* is the same as *P. cactorum. P. cactorum* is retained with reservations. *P. arecae, P. nicotianae,* and *P. syringae* must be considered of doubtful specific value as classifications until intensive study of a number of strains of these organisms has been made. *P. colocasiae, P. faberi, P. palmivora, P. parasitica, P. terrestris, P. parasitica rhei,* and *P. melongenae* should be merged with *P. omnivora; P. theobromae, P. allii, P. jatrophae, P. meadii,* and *P. hibernalis* probably also belong in that group. Hartley's organisms Nos. 8, 36, and 121 seem sufficiently distinctive to merit further study.

17099. LEVINE, MOSES N., and RALPH U. COTTER. A synthetic production of Puccinia graminis hordei. *Phytopath.* 21(1): 107. 1931.—Abstract. *P. g. secalis* × *P. g. tritici* resulted in a rust which attacks certain varieties of rye and wheat rather severely.

17102. YOUNG, ELAINE M. The morphology and cytology of Monascus ruber. *Amer. Jour. Bot.* 18(7): 499-517. 3 pl. 1931.—Preceding formation of a perithecium, an antheridium arises at the apex of a lateral branch; an outgrowth from the same hypha just beneath the antheridial septum becomes the ♀ organ. The 2 organs fuse and a passageway is formed; a trichogyne is separated from the rest of the ♀ branch by a septum. Nuclear migration occurs from the antheridium to the trichogyne and from the trichogyne through an opening into the ascogonium, where nuclei do not fuse. The ascogonium swells slightly and produces ascogenous hyphae as outer segments near its base. These hyphae grow up around the ascogonium and lie close to its surface. A protective covering is formed by sterile hyphae arising from the stalk below the ascogonium. The ascogenous hyphae become divided into cells, in which clearly defined associated nuclei are visible only in the later stages, although nuclei are present in these hyphae from the time of their origin. Terminal, second, or third cells of ascogenous hyphae may form asci, in which nuclear fusion results in the formation of the large nucleus having a well defined nucleole and reticulum. The 1st nuclear division of the ascus appears to be meiotic; 2 succeeding divisions result in formation of 8 daughter nuclei. Eight ascospores are formed in each ascus by the delimiting action of fibrous material arising from that part of the nucleus which is nearest the wall of the ascus. Ascus walls soon degenerate, leaving ascospores free in the perithecial cavity. *Monascus* belongs in the Aspergillaceae.—*Author's summary.*

MYXOMYCETES

17103. EMOTO, YOSHIKADZU. Javanische Myxomyceten. *Bull. Jard. Bot.* [*Buitenzorg*] 11(2): 161-164. 1931.—An annotated list of 44 from Java and Krakatoa, bringing the total number of spp. from these islands up to 95 and 12 respectively.

LICHENES

17104. GYELNIK, V. Parmelia glabra (Schaer.) Nyl. alakköre. [Forms of P. glabra.] *Magyar Bot. Lapok* 29: 15-18. 1930.—*P. glabra* var. fuscoides (p. 16), with its forms balcanica (p. 16), squamosa (p. 17), and quercicola (p. 17).—*C. Schermann.*

17105. GYELNIK, V. Ochrolechiae nonnullae novae. *Rep. Spec. Nov. 17110. **MÖNKEMEYER, WILH. Die Laubmoose Europas. Andreaeales-Bryales. [European mosses.]** *Rabenhorsts Kryptogamen-Flora von Deutschland, Österreich u. Schweiz.* Ergänzungsband 4(3) : 577-960. 226 fig. 1927.—Continuation of this handbook, with keys.

17111. **MÖRCH, OSCAR. Some interesting features in the life history of Funaria hygrometrica Sibth.** 12p. 7 fig. T. Buncle & Co.: Market Place, Arbroath, 1926.—Life history was studied in detail. Protonemata produced gemmae in insufficient light. Growth in height of the plants compensated for the irregularities in the surface of the substrate. Antherids and archegones on the same plant matured at different times. Mechanism for spore dissemination is discussed. A young sporophyte "grafted" to a young lettuce plant matured successfully. —*A. J. Sharp.*

17112. **ORTH, REINHARD. Vergleichende Untersuchungen über die Luftkammerentwicklung der Marchantiaceen mit Berücksichtigung ihrer Infloreszenzen.** *Flora* 24(2) : 152-203. 78 fig. 1929.—An investigation of spp. of *Marchantia, Preissia, Lunularia, Fegatella, Corsinia, Exormotheca, Targionia, Clevea, Fimbriaria, Grimaldia, Reboulia* and *Plagiochasma* shows that only in *Marchantia* and *Preissia* are the intercellular spaces which become the air chambers formed before the pores. In all the others the air chambers arise through the separation of cells from the surface inward. Leitgeb's conception of an upward growth of the surface cells around and over a point or region was wrong. The chambers and pores arise in the same manner on the inflorescences. In those species which have simple pores on the thallus and barrel-shaped ones on the inflorescences, the latter are formed like those of *Marchantia* except that the pores are there from the beginning of the chamber, and before the barrel cells are formed. Barrel-shaped pores are not due to pressure, as conceived by Leitgeb. The pores of the inflorescences are mostly smaller than those of the thalli, and show more cells in longitudinal section, i.e., the "barrels" are more cells long; also the inner or lower cells of the "barrel" are commonly much enlarged, thus leaving only a small opening. Complex chambers, as in *Grimaldia, Reboulia,* and *Plagiochasma,* arise through the separation of cells lining the original chambers in much the same manner as new chambers arise in the surface layer. Complexity does not come about through outgrowths from the floors and walls of simple chambers. The work substantiates the view that Marchantiaceae do not present an ascending line, beginning with *Marchantia,* as Leitgeb conceived; but a descending, reduced series, with *Marchantia* the most highly developed genus. The reasons for this view are: (a) Etiolated branches of *Marchantia* and *Preissia* never showed simple pores; (b) genera with simple pores show transitions to barrel-shaped pores; (c) the barrel-shaped pores in the inflorescence of those genera which have simple pores in the thallus are formed quite in the same manner as those in *Marchantia;* (d) the air chambers in the inflorescences gradually decrease in their distribution and disappear entirely in the antheridial ones of *Reboulia* and *Plagiochasma;* (e) in some genera with complex air chambers photosynthetic cells occur in some forms as branches from the walls of the chambers (*Wiesnerella, Stephansoniella*) while they may be lacking in all the other forms.—*T. C. Frye.*

SPERMATOPHYTA

FRANCIS W. PENNELL, *Editor*

(See also in this issue Entries 15124, 15169, 15190, 15195, 15208, 15308, 15309, 15314, 15329, 15333, 15338, 15343, 15345, 15351, 15356, 15358, 15366, 15369, 15374, 15384, 15490, 16811, 16907, 16937, 16957, 16971, 16987, 16992, 17000, 17014, 17030, 17048, 17060, 17069, 17270, 18068, 18114)

GYMNOSPERMAE

17130. **GAUSSEN, H., et M. LACASSAGNE. Les Épicéas du Kamtchatka.** *Bull. Soc. Hist. Nat. Toulouse* 59 (1) : 190-202. Illus. 1930.—The two spruces of Kamtchatka are *Picea jesoensis** (S. & Z.) Carr. and *P. kamtchatkensis** Lacass; both are described and figured. The new species appears to be northern and developed around Jelorka.—*H. Gaussen (transl. by P. A. Young).*

17131. **OSTENFELD, C. H., and C. SYRACH LARSEN. The species of the genus Larix and their geographical distribution.** *Kgl. Danske Videnskab. Selskab. Biol. Meddel.* 9 (2) : 3-106. 35 fig., 8 maps. 1930.—The authors recognize 10 spp. and 3 varieties, *L. griffithiana, mastersiana, potanini, occidentalis* and *lyallii* in one subgenus, *L. kaempferi, gmelini, siberica, decidua* and *laricina* in the other (neither named). A few hybrids, especially those occurring in nature, are treated. No new species nor combinations are presented but 3 varieties were recently described by the authors in another paper (*Pflanzenareale* 2: 7. 1930). The figures show photos of cones and habitat groups of trees.—*O. A. Stevens.*

17132. **VIGUIÉ, MARIE-THÉRÈSE, et HENRI GAUSSEN. Revision du genre Abies. Introduction à l'étude d'ensemble. I. Historique. II. Description du genre. III. Monographie et iconographie des espèces.** *Bull. Soc. Hist. Nat. Toulouse* 57 (4) : 369-434. 7 fig. 1928; 58 (3) : 245-564. illus. 1929. *Trav. Laboratoire forestièr de Toulouse* 2: 1-386.—The authors have undertaken a revision as complete as possible of the genus *Abies.* A comparative study of the morphology of the organs, paleontological history and evolution, geographical distribution, practical value of the species, and a bibliography are included. The classification enumerates 52 species and 12 varieties, among which are *A. borisii-regis* vars. **pungenti-pilosa** (Mattf. sub. forma in herb.) (p. 279), and **pseudocilicica** (*A. cephalonica apollinis* f. *p.* Guignier & Maire) (p. 281); *A. forrestii* var. **smithii** (p. 355), Yunnan; *A. koreana* var. **sikokiana** (*A. s.* Nakai) (p. 394); *A. nemorensis* var. **wilsonii** (*A. w.* Miyabe & Kudo) (p. 430); *A. nordmanniana* var. **macrolepis** (?) (p. 451).—*H. Gaussen (transl. by E. A. Baird).*

17133. **ZIEGENSPECK, [H.] Die Phylogenie der Coniferen.** *Ber. Westpreuss. Bot.-Zool. Vereins* 49. 45-60. 1927.

ANGIOSPERMAE (MIXED)

17134. **BÉGUINOT, AUGUSTO. Note Biologiche I. Partenocarpie in Stratiotes aloides L. II. Xanthium nigri Ces. Pass. e Gib. ed altre probabili mutazioni nel genere "Xanthium." III. Romulea rosea Eckl. avventizia in Australia. [I. Parthenocarpy in Stratiotes aloides. II. Xanthium nigri and other probable mutations in the genus Xanthium. III. Adventitious Romulea rosea Eckl. in Australia.]** *Atti Soc. Nat. e Mat. Modena* 60: 23-31. 1929.—*Stratiotes aloides* from lakes of Mantua thought to have only ♀ individuals more or less parthenocarpic, with no trace of the 70 ♂ individuals introduced there. In II, author publishes a new station along the upper lake of Mantua for *Xanthium nigri,* which is considered a mutant of *X. italicum* Moretti. Seedlings cultivated in garden showed forms intermediate between the two forms. Note III gives a new locality for *Romulea rosea* Eckl. (Iridaceae) supposedly imported with seed of other cultivated plants.—*H. D. Hill (from abstract of A. Béguinot).*

17135. **DIELS, L. Miscellanea sinensis III.** *Notizbl. Bot. Gart. u. Mus. Berlin-Dahlem* 10 (99) : 881-892. 1930. —Cyperaceae: *Cobresia* **kansuensis** Kükenthal (p. 881). Palmae: *Pinanga* **sinii** Burret (p. 882); *Rhapis* **gracilis** Burret (p. 883); *Calamus* **rhabdocladus** Burret (p. 884). Aristolochiaceae: *Asarum* **insigne** (p. 885). Anonaceae: *Polyalthia* **plagioneura** (p. 886). Crassulaceae: *Sedum* **progressum** (p. 887). Saxifragaceae: *Saxifraga* (*Kabschia* § *Marginatae*) **kansuensis** Mattf. (p. 887). Ochnaceae: **SINIA** (p. 888) (*Luxemburgieae*), with *S.* **rhodoleuca** (p. 889). Labiatae: *Scutellaria* **rehderiana** (p. 889); *Thymus serpyllum* ssp. **mongolicus** Ronniger (p. 890). Scrophulariaceae: *Pedicularis* **decorissima** (p. 891), Tibet; *P.* **chenocephala** (p. 892); *P. striata* var. **poliocalyx** (p. 892).—*A. M. Johnson.*

17136. **FISCHER, C. E. C. Plants new to Assam: III.** *Kew Bull. Misc. Inform.* 1931 (5) : 281-285. 1 fig. 1931.—*Impatiens* **cothurnoides*** (p. 281); *Jasminum* **wengeri** (p. 283); *Mantisia* **wengeri** (p. 283); *Chasalia* **lushaiensis** (*Gaertnera l.* Fischer) (p. 282); 8 known species not previously recorded in the province are listed.—*C. Fischer.*

17137. **GUILLAUMIN, A. Plantes nouvelles ou critiques des serres du Muséum.** *Bull. Mus. Nation. Hist. Nat.* [*Paris*] 1928 (4) : 281-283. 1928.—*Begonia lantanaefolia* A. DC., emended description; *B.* **majungaensis** (p. 281), Madagascar; *Schizopepon fargesii* Gagnep. has long been misidentified as *Actinostemma paniculatum;* the parents of × *Aloe spinosissima* Hort. are probably *A. arborescens* Mill. and *A. humilis* Haw.

17138. **HENDERSON, L. F. Some new species and varieties from Oregon.** *Rhodora* 32 (374) : 20-28. 1930.—*Scirpus* **malheurensis** (p. 20); *S. congdoni* var. **minor** (p. 21); *Juncus* **inventus** (p. 31); *Damasonium californicum* var. **biddlei** (p. 21); *Allium geyeri* var. **graniferum** (p. 22); *A.* **robinsonii** (p. 22); *A.* **mirabile** (p. 22); *A.* **punctum** (p. 23); *Iris* **innominata** (p. 23); *Montia* **sweetseri** (p. 24); *Silene* **insectivora** (p. 24); *S. montana* var. **viscida** (p. 25); *Ranunculus occidentalis* var. **dissectus** (p. 25); *Cardamine* **pattersoni** (p. 25); *Arabis* **wyndii** (p. 25); *Thermopsis* **subglabra** (p. 26); *Cotyledon* **glandulifera** (p. 26); *Dodecatheon* **poeticum** (p. 27); *Synthyris rotundifolia* var. **sweetseri** (p. 27); *Artemisia discolor* var. **glandulifera** (p. 27); *Chrysothamnus bloomeri* var. **pubescens** (p. 27); *Hieracium cynoglossoides* var. **ursinum** (p. 27); *Luina hypoleuca* var. **dentata** (p. 28); *Solidago californica* var. **aperta** (p. 28).—*S. F. Blake.*

17139. **PILGER, [R.], et al. Vermischte Diagnosen. V.** *Notizbl. Bot. Gart. u. Mus. Berlin-Dahlem* 10 (97) : 769-776. 1929.—Pilger describes *Deschampsia* **mildbraedii** (p. 769), Cameroons; FR. MARKGRAF describes *Freycinetia* **abbreviata** (p. 769), and *F.* **lombokensis** (p. 770), Malaysia, and *Blakea* **schultzei** (p. 770), Colombia; M. BURRET describes *Lepidocaryum* **tessmannii** (p. 771), Peru; O. C. SCHMIDT describes *Weinmannia* **velutina** (p. 772), Brazil, *W.* **ayavacensis** (p. 772), Peru, and *Elaeocarpus* **pseudosepicanus** (p 773), New Guinea; J. MATTFELD proposes *Stilpnopappus* **pickelii** (p. 774), Brazil, *Tafalla* **leptothamna** (p. 775), Peru, and *T.* **scolopendra** (*Baccharis s.* Hook.) (p. 776).—*A. M. Johnson.*

17140. **ST. JOHN, HAROLD. New plants from British Columbia.** *Rept. Prov. Mus. Nat. Hist.* (*Victoria B. C.*) 1927. 14-15. 1928.—Issued also as *Contr. Bot.*

Dept. State College of Washington No. 10. 2pp. 1928.) *Juncus* fucensis and *Draba* acinacis (both p. 14).—*H. St. John.*

17141. **STANDLEY, P. C.** New forms and varieties of Indiana plants. *Rhodora* 32(374): 32-34. 1930.—*Tradescantia reflexa* f. mariae (p. 32) and f. lesteri (p. 32); *Asclepias tuberosa* f. bicolor (p. 33); *Vernonia missurica* f. carnea (p. 33); *Coreopsis tripteris* var. deamii (p. 33) and var. intercedens (p. 34), Illinois.—*S. F. Blake.*

17142. **STAPF, O.** Plants from the Royal Botanic Gardens, Kew, etc. *Curtis's Bot. Mag.* 155(1): Tab. 9249-9259. 1929(1931).—Descriptions, with hand-colored plates, are given for the following species, each by O. Stapf unless otherwise stated: *Paeonia* tomentosa (*P. wittmanniana* var. *t.* Lomakin) (tab. 9249); *Salvia jurišićii** (the author, W. B. Turrill, states that Košanin's suggestion that *S. j.* represents a new section of the genus is justified by the peculiar morphology of the flower); *Kalanchoë delagoënsis**, *Cyrtanthus epiphyticus**; *Rhododendron adenogynum**; *Onosma hookeri* spp. wardii* (tab. 9254), Tibet; *Coelogyne ovalis** and *Acacia fimbriata** (by V. S. Summerhayes); *Allium* amabile* (*A. pyrrhorrhizum* Airy Shaw) (tab. 9257); *Reevesia pubescens**; *Rhododendron hypolepidotum**.

17143. **WERDERMANN, E.** Beiträge zur Kenntnis der Flora von Chile. IV. Über einige chilenische Polster-Opuntien. V. Vermischte Diagnosen 758. *Notizbl. Bot. Gart. u. Mus. Berlin-Dahlem* 10(97): 752-768. 1929.—IV. In the high Andes of the Chilean provinces of Atacama and Antofagasta occur a number of cushion-forming spp. of *Opuntia;* similar spp. occur also in adjoining areas of Argentina, Bolivia, and Peru. Four such are described and keyed: *O.* leoncito (p. 752), *O. rahmeri* Phil., *O. atacamensis* Phil., and *O. tarapacana* Phil., all from Chile. Part V discusses various other Chilean spp., including; *Danthonia* werdermannii Pilger (p. 758); *Phippsia* werdermannii Pilger (p. 759), with forms minor and major (p. 760); *Poa* (*Dioecopoa*) berningeri Pilger (p. 761); *P.* taltalensis Pilger (p. 762); *Carex* werdermannii Rud. Gross (p. 763); *Echinocactus* taltalensis (p. 763); *Cereus* deserticolus (p. 764); *Malesherbia* johnstonii (p. 765); *M.* glandulifera (p. 766); *Plantago* johnstoni Pilger (p. 767).—*A. M. Johnson.*

MONOCOTYLEDONES

17144. **AMES, OAKES, and EDUARDO QUISUMBING.** New or noteworthy Philippine orchids, I. *Philippine Jour. Sci.* 44(4): 369-383. 16 pl. (2 col.) 1931.—Descriptions and illustrations, from living material, are given of: *Adenostylis* merrillii* (p. 370); *Haemaria discolor** Lindl., new for the Philippines; *Dendrobium chameleon* v. ovatilabium* (p. 372), and *D. c.* f. alba (p. 373); *D.* miyasakii* (p. 373); in *Eria aporoides* Lindl. the pollen masses are 8 in number, hence Merrill's transfer of the sp. to *Dendrobium* is not accepted; *E.* longissima* (p. 374); *Bulbophyllum biflorum** Teijsm. and Binn., first authentic report from Philippines; *B.* emiliorum* (p. 377); *B. antenniferum** (Lindl.) Reichb. f.; *B. ebracteolatum** Kränzl.; and *B. ornatissimum** (Reichb. f.) J. J. Sm., a species previously known only from Assam and Sikkim, India.

17145. **BILL, J. P.** Carex knieskernii Dewey. *Rhodora* 32(380): 162-166. 1930.—Discussion of history of this sp., with conclusion that it is probably a distinct sp. and not a hybrid.—*S. F. Blake.*

17146. **BLAKE, S. F.** The typification of Scirpus capitatus L. *Rhodora* 30(381): 182-185. 1930.—Maintains, in reply to Farwell (see entry 17157), that Clayton 380 is the type of *Scirpus capitatus* L., and that his interpretation of the name *Eleocharis capitata* (L.) R. Br. in the sense of *E. tenuis* (Willd.) Schult. is correct.—*S. F. Blake.*

17147. **BURRET, M.** Die Palmengattungen Orbignya, Attalea, Scheelea, und Maximiliana. *Notizbl. Bot. Gart. u. Mus. Berlin-Dahlem* 10(97): 651-701. 1929.—A conspectus of the spp. of *Scheelea* and *Maximiliana.* A key to the spp. is given for each genus. New to science are: *Scheelea* sects. SYNALPHOCARYUM (p. 652) and DIALPHOCARYUM (p. 653); *S.* bassleriana (p. 655), Peru; *S.* weberbaueri (p. 659), Peru; *S.* huebneri (p. 663), Amazon; *S.* passargei (p. 671), Venezuela; *S.* cubensis (p. 671), Cuba; *S.* urbaniana (p. 672), Tobago; *S.* stenorhyncha (p. 675), Peru; *S.* preussii (p. 678), Guatemala; *S.* brachyclada (p. 680), Peru; *S.* tessmannii (p. 682), Peru; *S.* costaricensis (p. 684), Costa Rica; *S.* macrolepis (p. 688), Venezuela; *Maximiliana* macrogyne (p. 692), Brazil; *M.* stenocarpa (p. 696), Peru; *M.* macropetala (p. 699), Venezuela. New combinations are: *Scheelea* wallisii (*Attalea w.* Huber) (p. 657); *S.* humboldtiana (*A. h.* Spruce) (p. 658); *S.* goeldiana (*A. g.* Huber) (p. 658); *S.* martiana (*A. excelsa* Mart. non Karst.) (p. 661); *S.* gomphococca (*A. g.* Mart.) (p. 666); *S.* tetrasticha (*Maximiliana ? t.* Drude) (p. 667); *S.* phalerata (*Attalea p.* Mart.) (p. 669); *S.* blepharopus (*A. b.* Mart.) (p. 674); *S.* maracaibensis (*A. m.* Mart.) (p. 676); *S.* rostrata (*A. ? r.* Oerst.) (p. 688). Nomina nuda are: *Schleelea imperialis* Hort., *S. macipi* Hort., *Maximiliana jagua* Seem., *M. panamensis* Linden and *M. spiralis* Linden.—*A. M. Johnson.*

17148. **BURRET, M.** Iriarteae. *Notizbl. Bot. Gart. u. Mus. Berlin-Dahlem* 10(99): 918-942. 1930.—A conspectus of some spp. of *Socratea, Iriartea, Dictyocaryum, Catoblastus, Catostigma, Wettiniicarpus,* and *Wettinia*—all from South America. New to science are: *Socratea* macrochlamys (p. 918), Colombia; *Iriartea* gigantea H. Wendl. in scheda (p. 920), Costa Rica; *I.* weberbaueri (p. 921), Peru; *I.* megalocarpa (p. 921). *Dictyocaryum* schultzei (p. 925) and *D.* platysepalum (p. 927), Colombia; *Catoblastus* engelii H. Wendl. in scheda (p. 928), Venezuela; *C.* velutinus (p. 929), Colombia; *C.* mesocarpus (p. 930), Venezuela; *C.* microcarpus (p. 931), *Catostigma* megalocarpum (p. 935) and *C.* kalbreyeri (p. 935), Colombia; *C.* sphaerocarpum (p. 936), Colombia, with var. microcaryum (p. 937): WETTINIICARPUS (p. 937) with *W.* fascicularis (p. 938), Colombia; *Wettinia* weberbaueri (p. 939), Peru; *W.* hirsuta (p. 941), Colombia. New combinations are: *Catostigma* drudei (*Catoblastus d.* Cook et Doyle) (p. 932); *C.* aequale (*Acrostigma equale* Cook et Doyle) (p. 934); *Wettinia* quinaria (*Wettinellia q.* Cook et Doyle) (p. 942).—*A. M. Johnson.*

17149. **BURRET, M.** Palmae novae Luetzelburgianae. *Notizbl. Bot. Gart. u. Mus. Berlin-Dahlem* 10(100): 1013-1026. 1930.—*Manicaria* atricha (p. 1013); *Geonoma* leptostachys (p. 1014), Rio Negro region; *G.* macropoda (p. 1015); *G.* major (p. 1016) and *G.* parvisecta (p. 1018), Rio Negro region; *Orbignya* luetzelburgii (p. 1019), Amazonas; *Astrocaryum* gymnopus (p. 1020), Orinoco region of Venezuela; *A.* luetzelburgii (p. 1021), Rio Uaupes; *Bactris* luetzelburgii (p. 1022), Cassiquiare, Venezuela; *B.* lanceolata (p. 1023), Rio Negro; *B.* gymnospatha (p. 1024), Cassiquiare, Venezuela; *Desmoncus* luetzelburgii (p. 1025), Rio Papori; *D.* angustisectus (p. 1025). Unless otherwise stated, species are from Brazil.—*A. M. Johnson.*

17150. **BURRET, M.** Über Leopoldinia piassaba Wallace, die Stammpflanze der Pará-Piassave. *Notizbl. Bot. Gart. u. Mus. Berlin-Dahlem* 10(100): 1027-1028. 1930.—*Leopoldinia piassaba* yields the Pará-Piassave of commerce, so called because exported from Pará. From Spruce's description and from photographs supplied by Luetzelburg, Burret finds that Wallace's figure of the plant is quite correct. Luetzelburg found the species practically exterminated in certain localities. This collector gathered specimens at Capihuara and Santa Isabel on the Cassiquiare (Venezuela), where it goes by the name "Chiqule-Chiqule." According to Wallace and Spruce the palm is called "Chiquichiqui." In northern Brazil it is called "Piassaba." The Brazilian name "piassava" has also been applied to the palm *Attalea funifera* Mart., the source of the valuable "Bahia-Piassave" of commerce, and this erroneous transfer of the name has led to the belief that *Attalea funifera* ranged into Venezuela.—*A. M. Johnson.*

17151. **BURRET, M.** Palmae novae austroamericanae. *Notizbl. Bot. Gart. u. Mus. Berlin-Dahlem* 11(101): 1-19. 1930.—*Mauritia* minor (p. 1); *Chamaedorea* minor (p. 2) and *Socratea* microchlamys (p. 3), Venezuela; *Catostigma* anomalum (p. 4); *Phytelephas* dasyneura (p. 5); *Geonoma* woronowii (p. 6); *G.* lanceolata (p. 7), Brazil; *G.* triglochin (p. 8); *G.* longepedunculata (p. 8); *G.* oligoclada (p. 9), Brazil; *G.* euspatha (p. 10); *Taenianthera* (genus emended) lakoi (p. 11), Brazil; *T.* multisecta (p. 13); *T.* gracilis (p. 14), Brazil; *Astrocaryum* guara (p. 15); *Bactris* obovata (p. 16); *B.* hirsuta (p. 17); and *B.* stictacantha (p. 18). From Colombia, unless otherwise stated.—*A. M. Johnson.*

17152. **BURRET, M.** Eine neue Palmengattung aus Südamerika. *Notizbl. Bot. Gart. u. Mus. Berlin-Dahlem* 11(101): 48-51. 1930.—**PARAJUBAEA** (p. 48), based on *P.* cocoides* (p. 48), is grown in public places in the town of Ibarra but is indigenous to the region east of Quito, in the vicinity of Papallacta, Ecuador. *P.* torallyi (*Diplothemium t.* Mart.) (p. 50), of Bolivia, is questionably of this genus.—*A. M. Johnson.*

17153. **DEWEY, LYSTER H.** A new variety of henequen without prickles. *Journ. Washington Acad. Sci.* 19(18): 415-416. 1929.—*Agave fourcroydes* v. espiculata (p. 416), Cuba; originating as a mutation in one plant in a cultivated plantation, is continued in its progeny. It differs from the typical form of the species in the absence of prickles on the leaf margins.—*L. H. Dewey.*

17154. **DUCELLIER, L.** Céréales recueillies par M. le Dr. R. Maire au cours de la "Mission du Hoggar." *Bull. Soc. Hist. Nat. Afrique du Nord* 20(8): 221-226. 2 pl. 1929.—Notes on the distribution and character of different varieties of cultivated grains in the Sahara. *Triticum durum* var. intermedium (p. 222), Algerian Sahara, is new.

17155. **EATON, R. J.** Tripsacum dactyloides in Massachusetts. *Rhodora* 30(381): 185. 1930.—At Westport Point, the first Massachusetts locality.—*S. F. Blake.*

17156. **FARWELL, OLIVER ATKINS.** What is Scirpus glaucescens Willd.? *Rhodora* 32(374): 30-31. 1930.—Identified, on basis of description, with *Eleocharis acuminata* (Muhl.) Nees. [See also entry 17160.]—*S. F. Blake.*

17157. **FARWELL, OLIVER ATKINS.** What is Scirpus capitatus Linn.? *Rhodora* 32(381): 180-181. 1930.—Claims that Blake's transfer in 1918 of the name *Eleocharis capitata* (L.) R. Br. to the species usually known as *E. tenuis* (Willd.) Schultes is incorrect, and that "*E.* capitatus (L.) n. comb." (p. 181) should be used in place of *E. obtusa* (Willd.) Schultes. [See also entry 17146.]—*S. F. Blake.*

17158. **FARWELL, OLIVER ATKINS.** Aira spicata, Linn., and the application of the International Rules. *Rhodora* 32(384): 261-263. 1930.—Holds that the 2 spp. named *Aira spicata* L. in 1753 are to be known as *Trisetum spicatum* (L.) Richt. and *Panicum* spicatum (*Aira spicata* L.) (p. 262).—*S. F. Blake.*

17159. **FERNALD, M. L.** Carex macrocephala and C. anthericoides. *Rhodora* 32(373): 9-11. 1930.—*C. anthericoides* Presl, of the western N. Amer. coast, is distinct from the Asiatic *C. macrocephala* Willd., to which it has been referred. The latter has been found twice as an introduction on the New Jersey coast.—*S. F. Blake.*

17160. **FERNALD, M. L.** Willdenow's type of Scirpus glaucescens. *Rhodora* 32(374): 31-32. 1930.—The type in the Willdenow herbarium has 2 style-branches, and is considered to be correctly referred to the *Eleocharis palustris* group, in opposition to Farwell's opinion [see entry 17156].—*S. F. Blake.*

17161. **FERNALD, M. L.** The complex Bromus ciliatus. (*Contrib. Gray Herb.* 87(4):) *Rhodora* 32(376): 63-71. 1 pl. 1930.—*Bromus* dudleyi* (p. 63), Newfoundland (type) to British Columbia, south to New England, Minnesota, and Montana; *B. ciliatus* var. genuinus* (p. 70), and var. intonsus* (p. 70), Newfoundland to Pennsylvania and Michigan, type from Massachusetts.—*S. F. Blake.*

17162. **FERNALD, M. L.** Potamogeton alpinus and P. microstachys. (*Contrib. Gray Herb.* 87(6):) *Rhodora* 32(376): 76-83. 1 pl. 1930.—*Potamogeton alpinus** Balbis is restricted to Europe, its N. Amer. and Siberian representative being *P. microstachys* Wolfg. with var. typicus* (p. 80) and var. subellipticus* (p. 82), Newfoundland to British Columbia, south to New England, Michigan, and Wyoming, the type from Magdalen Islands.—*S. F. Blake.*

17163. **FERNALD, M. L.** The identities of Juncus canadensis and of J. brevicaudatus. (*Contrib. Gray Herb.* 87(7):) *Rhodora* 32(376): 83-88. 1 pl. 1930.—Critical discussion, with conclusion that Mackenzie was in error in shifting name *J. brevicaudatus* (Engelm.) Fernald to synonymy of *J. brachycephalus* (Engelm.) Buchenau.—*S. F. Blake.*

17164. **FERNALD, M. L.** The identity of Alopecurus aequalis. *Rhodora* 32(382): 221-222. 1930.—Maintains that Jansen and Wachter are in error in regarding the identification of *A. aequalis* Sobol. with *A. aristulatus* Michx. as too doubtful to be adopted.—*S. F. Blake.*

17165. **FOGG, JOHN M. Jr.** Tipularia discolor in Dukes County, Massachusetts. *Rhodora* 32(378): 114-117. 1930.—On Martha's Vineyard and Nashawena Island.—*S. F. Blake.*

17166. **HARMS, H.** Bromeliaceae. IV. *Notizbl. Bot. Gart. u. Mus. Berlin-Dahlem* 11(101): 57-61. 1930.—*Puya* stenostele (p. 57), Peru; *P.* woronowii (p. 58), Colombia; *Pitcairnia* laresiana (p. 58), Peru; *Tillandsia* ekmanii (p. 59), Haiti; *Aechmea* woronowii (p. 61), Colombia.—*A. M. Johnson.*

17167. **HENDERSON, M. R.** Halophila spinulosa (R. Br.) Aschers. *Gardens' Bull. Straits Settlements* 5(7/8): 240. 1931.—New to the Malay Peninsula.

17168. **HITCHCOCK, A. S.** The grasses of Central America. *Contrib. U. S. Nation. Herb.* 24(9): 557-762. 1930.—A descriptive treatment of the family Poaceae in the region from Panama north to the southern boundary of Mexico, with keys to tribes, series, genera, and spp., descriptions of genera and spp., synonymy, range, and indication of type locality, brief bibliography, and list of numbered exsiccatae. There are 115 genera and 460 spp. included. The following are new: *Hierochloe* mexicana (Rupr.) Benth. (*Ataxia m.* Rupr.) (p. 614); *Ichnanthus* standleyi (p. 662), Honduras.—*S. F. Blake.*

17169. **KNOWLTON, C. H.** Butomus umbellatus at Lake Champlain. *Rhodora* 32(374): 18-19. 1930.—At Dresden, New York.—*S. F. Blake.*

17170. **LOESENER, TH.** Zingiberaceae novae vel minus cognitae II. *Notizbl. Bot. Gart. u. Mus. Berlin-Dahlem* 10(97): 706-716. 1929.—*Aframomum* chlamydanthum Loes. et Mildbr. (p. 706), Kameruns; *Costus* (*Eucostus*) erythrophyllus (p. 707), eastern Peru; *C.* (*E.*) fortalezae K. Schum. (p. 708), Amazonas, Brazil; *C.* (*E.*) tarmicus (p. 709), Peru; *C.* (*E.*) ulei (p. 709), Amazonas, Brazil; *C. malortieanus* var. amazonicus (p. 710), Peru; *C.* (*E.*) lasius (p. 710), Peru; *C. pubescens* f. fibrillosa (p. 711), Brazil; *C.* (*E.*) validus (p. 711), northern Brazil (Peru?); *C.* (*E.*) gracilis (p. 711), northern Brazil (Peru?); *C. cylindricus* var. acreanus (p. 712), northern Brazil; *C.* (*E.*) weberbaueri (p. 712), Peru; *C.* (*E.*) erythrothyrsus (p. 713), eastern Peru; *C.* (*Cadalvena*) steinbachii (p. 714), Bolivia; *C.* (*C.*) kaempferoides (p. 714), northwestern Brazil; *Dimerocostus* tessmannii (p. 715), eastern Peru; *D.* bolivianus (*Mulfordia boliviana* Rusby) (p. 716).—*A. M. Johnson.*

17172. **MARLOTH, R.** Notes on Aloe spicata Linn. fil. *Bothalia* 3(1): 142-146. 2 fig. 1930.—Discussing the identity of *Aloe spicata* L. f. the author concludes that this is the plant now usually called *A. speciosa* Baker.—*M. O. Malte.*

17173. **MICZYNSKI, CASIMIR.** Notes systématiques sur le genre Aegilops. *Bull. Soc. Bot. France* 76(7/8): 713-719. 1 pl., 8 fig. 1929.—The author agrees with Ascheron that *A. ligustica* Coss. and *A. aucheri* Boiss. are subspecies of *A. speltoides*, with a single Mendelian factor. He finds with Percival that the pubescence on the leaf is distinctive, describing and figuring 6 types.

The following are described: *A. ventricosa* var. **obscura** (p. 715), Algeria; *A. truncialis* var. *persica* subv. **hispida*** (Afghanistan) and subv. **glauca*** (Transcaspia) (p. 716). The plate represents *A. aucheri* var. *polyathera** Boiss., a polymorphic race.—*O. A. Stevens.*

17174. **MUENSCHER, W. C.** Butomus umbellatus in the Lake Champlain Basin. *Rhodora* 32(374): 19-20. 1930.—Generally distributed along the southern part of the Lake, in New York and Vermont.—*S. F. Blake.*

17175. **PEASE, ARTHUR STANLEY.** A Carex new to New England. *Rhodora* 32(383): 258. 1930.—*Carex anguillata* Drejer, from Mt. Katahdin, Maine.—*S. F. Blake.*

17176. **POTTS, GEORGE.** Orchids of Mid-Shropshire [England]. *Northwestern Naturalist* 6(3): 163-164. 1931.—List with localities.

17177. **RUHLAND, W.** Neue Eriocaulon-Arten aus China. *Notizbl. Bot. Gart. u. Mus. Berlin-Dahlem* 10 (100): 1040-1044. 1930.—*Eriocaulon* **huianum** (p. 1040), southeastern China; *E.* **whangii** (p. 1040), *E.* **sinii** (p. 1041), *E.* **kwantungense** (p. 1042), *E.* **kengii** (p. 1042) and *E.* **yaoshanense** (p. 1043), southern China. —*A. M. Johnson.*

17178. **SMITH, J. J.** Vanda × **boumaniae, J. J. S.** *Gardens' Bull. Straits Settlements* 5(7/8): 232-233. 1931. —× *Vanda* **boumaniae** (p. 232), Alor Isl., Sunda Isls., apparently a hybrid between *V. insignis* and *V. limbata.*

17179. **SOÓ, RUDOLF von.** Revision der Orchideen Südosteuropas und Südwestasiens. [Revision of the Orchidaceae of southeastern Europe and southwestern Asia.] *Bot. Arch.* [*Königsberg*] 23(1/2): 1-196. 1928.—A critical survey is made of the Orchidaceae of the region with the main emphasis upon the designation of the more important forms already described or not previously named, with Latin descriptions in key form. Every known species from the area under consideration is included, together with the important references, geographical distribution, synonymy, recognizable forms, numbers of exsiccatae studied, and, at the end of the paper, a catalogue listing the specimens examined under each species, the localities being given by definite geographical units. A table gives the geographic distribution of every species and the principal varieties and subspecies. The list contains 131 species of Orchidaceae (37 listed as hybrids) with the following proposals: *Ophrys araneifera* f. **pseudaraneifera** n. comb. (p. 29); *Orchis patens* ssp. **orientalis** (*O. patens canariensis orientalis* Rchb. f.) (p. 50); *O. saccatus* ssp. **fedtschenkoi** (*O. f.* Czerniak.) (p. 51); *O. anatolicus* f. **rariflorus** (*O. rariflora* C. Koch.) (p. 56); *O. romanus* l. **sulphureus** (*O. sulphurea* Spr.) (p. 63); *O. holocheilos* var. **osmanicus** (*O. h.* ssp. *o.* Klinge) (p. 73); *O. maculatus* f. **sacciferoides** (*O. s.* Klinge in Sched. et ap. Gand. sol. nom.) with Latin description (p. 76), Germany and Bohemia; *Serapias lingua* ssp. **durieui** (*S. lingua* v. *d.* Rchb. f.) (p. 85); *S. l.* ssp. **excavata** (*S. e.* Schlecht.) (p. 85); *S. l.* ssp. **oxyglottis** (*S. o.* Willd.) (p. 85); *Platanthera micrantha* var. **longibracteata** (*P. l.* Hochst.) (p. 104); *Limodorum abortivum* f. **sphaerolabium** (*L. s.* Viv.) (p. 108); *Peramium* **macrophyllum** (*Epipactis macrophylla* Eaton) (p. 110); *Cephalanthera longifolia* f. **pilosa** (*Epipactis l.* f. *p.* Harz.) (p. 114); *C. l.* ssp. **acuminata** (*C. a.* Lindl. ap. Wall.) (p. 114); *Helleborine palustris* f. **gracilis** (Höppn.) (p. 116). There are diagnostic keys in Latin wherever more than one form is listed under a species. Emended descriptions are given for *Orchis blyttii* Soo and *O. graggerianus* Soo.—*I. L. Wiggins.*

17180. **STEBBINS, G. L. Jr. III.** A revision of some North American species of Calamagrostis. (*Contrib. Gray Herb.* 87(3):) *Rhodora* 32(375): 35-57. 1 pl. 1930.—Eleven species of sections *Calamagris, Deyeuxia* and subsection *Orthoatherae* are keyed and described, with synonymy and citation of exsiccatae. The following are new: *C. canadensis* var. **macouniana** (*Deyeuxia m.* Vasey) (p. 41), var. **arcta*** (p. 45), Labrador, var. **pallida** (*C. p.* Vasey & Scribn.) (p. 45); *C. scribneri* var. **imberbis** nom. nov. (*C. anomala* Suksd., not Steud.) (p. 46); *C. scopulorum* var. **bakeri** (p. 47), Colorado; *C. inexpansa* var. **robusta** (*C. stricta* var. *r.* Vasey) (p. 48), var. **brevior*** (*C. stricta* var. b. Vasey) (p. 50), var. **novae-angliae*** (p. 51), Maine; *C. neglecta* var. **micrantha** (*C. m.* Kearney) (p. 55); *C. lapponica* var. **brevipilis*** (p. 56), Quebec.—*S. F. Blake.*

17181. **WHEELER, L. A.** Scirpus peckii in Maine. *Rhodora* 32(379): 133. 1930.—At Albany, the first authentic record for Maine.—*S. F. Blake.*

DICOTYLEDONES

17182. **AFZELIUS, K.** Sur deux Convolulacées nouvelles de Madagascar. *Svensk Bot. Tidskr.* 23(2): 179-183. 2 fig. 1929.—**PENTACROSTIGMA** (p. 181), erected for *P.* **nyctanthum*** (p. 182); *Porana* **parvifolia*** (p. 182).

17183. **BACIGALUPI, RIMO.** A monograph of the genus Perezia, section Acourtia, with a provisional key to the section Euperezia. *Contrib. Gray Herb. Harvard Univ.* 97. 1-81. 7 pl. 1931.—The author reviews in detail the taxonomic history of the genus and discusses geographical distribution, generic concept and relationships, classificatory difficulties, and economic uses. Endemism is a marked feature of the mainly Mexican § *Acourtia*. Mexican Indians use various spp. as a purgative. The following, all from Mexico, are described: *Perezia* **scapiformis*** (p. 15); *P.* **lobulata*** (p. 16); *P.* **dissiticeps*** (p. 17); *P.* **aspera*** (p. 18); *P. rigida* var. **linearifolia** (p. 18); *P. r.* var. **acuminata*** (p. 19); *P. montana* var. **intermedia** (p. 19); *P. dugesii* var. **pilulosa*** (p. 19). The taxonomic account includes diagnoses of the genus and the 2 sections, *Acourtia* and *Euperezia*, and keys to the sections and to the species included in each. The treatment of the 44 spp. of *Acourtia* includes synonymies, descriptions, distributional records, and taxonomic remarks. *P. alamani* var. **adnata** (*P. adnata* Gray) (p. 64); *P. alamani* var. **oolepis** (*P. adnata* var. *o.* Bartlett) (p. 65). About 13 doubtful or uncertain spp. are also discussed. *Vernonia* **vernonioides** (*Perezia v.* Gray = *Vernonia jaliscana* Gleason) (p. 77).

17184. **BEMIS, E. W.** A new form of Aster amethystinus. *Rhodora* 32(373): 3. 1930.—*A. amethystinus* Nutt. f. **leucerythros**, Massachusetts.—*S. F. Blake.*

17185. **BENKE, H. C.** Aster amethystinus an obvious hybrid. *Rhodora* 32(373): 1-3. 1 pl. 1930.—Considered a hybrid of *A. novae-angliae* and *A. multiflorus*, on basis of its characters and occurrence in company with these species.—*S. F. Blake.*

17186. **BENOIST, RAYMOND.** Moracées nouvelles de la Guyane française. *Bull. Mus. Nation. Hist. Nat.* [*Paris*] 1(2): 163-164. 1929.—**ALITERIA** (p. 163), erected for *A.* sagoti (p. 163); *Ficus* maroniensis (p. 164); *F.* **vulpina** (p. 164).

17187. **BLAKE, S. F.** A glabrous variety of Aster concolor. *Rhodora* 32(380): 144-145. 1930.—*Aster concolor* var. **devestitus**, Florida.—*S. F. Blake.*

17188. **BORNMÜLLER, J.** Kritische Bemerkungen über einige orientalische Arten der Gattung Johrenia nebst Beschreibung zweier neuer Typen. *Rep. Spec. Nov. Reg. Veg.* 28(751/755, paper 6): 33-53. 1930.—This paper consists of a discussion of the known European and Asiatic species,—many confined to small geographical areas, some known only from the original collection. The long-recognized *J. pichleri* Boiss. appears to be *Peucedanum alsaticum* L. No specimens of *J. selinoides* of undoubted European origin are to be found; the species is therefore questionably European. *J. distans* (Griseb.) Halácsy (= *J. graeca* Boiss. & Sprun); *J.* **thessala** (p. 37), Greece. A general discussion of *Johrenia* within the area of Boissier's "Flora Orientalis" is followed by a detailed account of each of the following species: *J. fungosa* Boiss.; *J. dichotoma* DC. with ssp. **sintenisii** (p. 44); *J.* **polyscias** (p. 44), Galatia; *J.* ? *juncea* Boiss.; *J. engleri* Dingler; *J. westii* Post; *J. selinoides* Boiss. & Bal.; *J. porteri* Post; *J. alpina* Fenzl; *J. berytea* Boiss. & Hausskn.; *J. aurea* Boiss. & Bal.; *J. platycarpa* Boiss.; *J. paucijuga* (DC.) Bornm. (= *J. persica* Boiss. and *J. candollei* Boiss.); and *J. platypoda* Aitch & Hemsl. The following are excluded from the

genus: *J. meyeri* Boiss. (*Peucedanum pauciflorum* Led.), *J. scoparia* Boiss., *J. tordylium* Fenzl, which is *Coriandrum* t. (Fenzl) n. comb., and *J. longifolia* Calest. By Koso-Poljansky (1920) only two species of *Johrenia* are recognized in eastern Asia,—*J. seselioides* (Hoffm.) K.-Polj. and ? *J. sieversii* (C. A. Mey.) K.-Polj.—*H. K. Svenson.*

17189. **BROWN, FOREST B. H.** Cornaceae and allies in the Marquesas and neighboring islands. *Bernice P. Bishop Mus. Bull.* 52. (*Bayard Dominick Exped. Publ.* 13.) 3-22. 5 fig. 1928.—**LAUTEA** (p. 5), with *L.* **serrata** (p. 9) and *L.* **stokesiana**, the latter with vars. **primaeva** (p. 7), **denticulata** (p. 7) and **integrifolia** (p. 8), are described and figured. Chapters are devoted to comparative morphology, venation, wood characters, geological history. Although the present species of *Cornus* and its allies are widely distributed, a study of the fossil history leads the author to conclude that the geological history of *Lautea* of the Austral Is., *Corokia* of New Zealand and *Cornus* is closely linked and that they have had a common center of origin in or near North America. He finds also that the Cornaceae show closer relationship to the Celastrales than to the Umbellales.—*F. Detmers.*

17190. **BURKILL, I. H.** An enumeration of the species of Paramignya, Atalantia and Citrus, found in Malaya. *Gardens' Bull. Straits Settlements* 5(7/8) : 212-223. 1931. —An annotated list of 25 spp., with partial keys and synonymic, descriptive, distributional, and economic notes. The name *Paramignya* is retained for spp. without pulp-cells; *Atalantia* for those with pulp-cells. *Eremocitrus* Swingle, *Fortunella* Swingle, and *Microcitrus* Swingle are reduced to sectional rank under *Citrus.*

17191. **BURKILL, I. H.** Erythropsis colorata, Burkill, comb. nov. *Gardens' Bull. Straits Settlements* 5(7/8) : 231. 1931.—*E.* colorata (*Sterculia c.* Roxburgh).

17192. **CAMUS, AIMÉE.** Castanopsis nouveaux de Chine. *Bull. Mus. Nation. Hist. Nat.* [*Paris*] 1(2) : 165. 1929.—*Castanopsis* **incana** and *C.* **chingii**, both from Chekiang.

17193. **CHASSIGNOL, F.** Convolvulus dahuricus Sims en Saône-et-Loire [France]. *Soc. Hist. Nat. d'Autun, Bull.* 29(3) : 144-145. 1930.

17194. **CHATEAU, E.** Bidens connatus Muhlenberg, plante nouvelle pour Saône-et-Loire [France]. *Soc. Hist. Nat. d'Autun, Bull.* 29(3) : 142-144. 1930.

17195. **CLAUSEN, J.** Danmarks viol-arter. [The viola species of Denmark.] *Bot. Tidsskr.* [*Copenhagen*] 41(4) : 317-335. 13 fig. 1931.—Twelve species (with key) are listed, also some hybrids.

17196. **CORY, V. L.** A new loco from the Edwards Plateau of Texas. *Rhodora* 32(373) : 4-7. 1930.—*Astragalus* **argillophilus** (p. 5).—*S. F. Blake.*

17197. **CORY, V. L.** A new Salviastrum from the Edwards Plateau of Texas. *Rhodora* 32(376) : 89-90. 1930.—*Salviastrum* **dolichanthum** (p. 90).—*S. F. Blake.*

17198. **CORY, V. L.** A new Lesquerella from western Texas. *Rhodora* 32(378) : 110. 1930.—*Lesquerella* **lepidota**.—*S. F. Blake.*

17199. **COSTELLO, DAVID F.** Preliminary reports on the flora of Wisconsin. XIII. Fagaceae. *Trans. Wisconsin Acad. Sci., Arts and Lett.* 26: 275-279. 7 maps. 1931. —A list of 9 spp., with notes on status and habitat and with maps showing distribution within the state. A key to the Wisconsin spp. of *Quercus* is given.

17200. **DANSER, B. H.** Nepenthaceae. In: **EDGAR IRMSCHER:** "Beiträge zur Kenntnis der Flora von Borneo," paper 12. *Mitteil. Inst. Allg. Bot. Hamburg* 7(3) : 217-221. 1 pl. 1931.—Four species of *Nepenthes* are recorded, with locality data. *N. ephippiata** Danser, emended description.

17201. **DAVIS, BRADLEY MOORE.** Lamarck's evening primrose (Oenothera lamarckiana Seringe) was a form of Oenothera grandiflora Solander. *Proc. Amer. Phil. Soc.* 66: 319-355. 5 pl., 1 fig. 1927.—Paper develops in detail from personal study of material at Paris and elsewhere views of the author (1912) in opposition to conclusions of de Vries on the identity of Lamarck's evening primrose and the origin of de Vries's *lamarckiana*. *O. lamarckiana* of de Vries is not the plant grown by Lamarck in Paris about 1796, described by Lamarck under the name *Aenothera grandiflora* and renamed by Seringe (1828) *Oenothera lamarckiana*. Lamarck's plant was a form of *O. grandiflora* Solander as shown by two sheets in Herbarium of Lamarck at the Muséum d'Histoire Naturelle. Specimens from the herbarium of Abbé Pourret, also believed by de Vries to be his plant, are likewise *O. grandiflora*. Specimens from the Herbarium Michaux in Paris, regarded by de Vries as evidence that Michaux collected *lamarckiana* in North America, are neither *lamarckiana* nor *grandiflora*. Apparently the earliest known date for *lamarckiana* of de Vries in Europe is about 1860, and the plant was introduced by Carter and Co. from English sources. There were in cultivation in England as early as 1830 narrow-leaved, large-flowered Oenotheras with the pubescence of *lamarckiana* and from such material *lamarckiana* might have arisen, possibly as a hybrid. Although *Oenothera lamarckiana* Seringe is a synonym of *O. grandiflora* Solander it is best that de Vries's plant should retain its name, established in genetical literature, but it should be understood as *Oenothera lamarckiana* of de Vries.—*B. M. Davis.*

17202. **DAVY, J. BURTT.** The origin of Symphoricarpus. *Science* 72(1861) : 220. 1930.—Note on paper by Karl Sax and D. A. Kribs, who state the probable origin of the family Caprifoliaceae to be Asiatic, in which the author questions their assumption that there was ever more than one species of *Symphoricarpus* in China.

17203. **EAMES, EDWIN H.** Cubelium concolor. *Rhodora* 32(379) : 140-142. 1930.—*Cubelium concolor* f. **subglabrum**, Georgia.—*S. F. Blake.*

17204. **EATON, R. J.** Color variation in Gentiana linearis. *Rhodora* 32(380) : 143-144. 1930.—Discusses color variation in *G. linearis* Froel and f. *blanchardii* Fernald.—*S. F. Blake.*

17205. **FERNALD, M. L.** Ligusticum scothicum of the North Atlantic and of the North Pacific. (*Contrib. Gray Herb.* 87(1) :) *Rhodora* 32(373) : 7-9. 2 pl. 1930.—*L.* **hultenii** (p. 7), Alaska (type), Kamtchatka, Japan, the Pacific representative of *L. scothicum* L.—*S. F. Blake.*

17206. **FERNALD, M. L.** A new willow from the Côte Nord, Quebec. *Rhodora* 32(378) : 112-113. 1 pl. 1930. —*Salix* **simulans*** (p. 112).—*S. F. Blake.*

17207. **FERNALD, M. L.** The Cape Cod Ceanothus. *Rhodora* 32(380) : 161-162. 1930.—The "Middle" Cape Cod form of *Ceanothus americanus* L. is var. *intermedius* (Pursh) Trelease, previously recognized from South Carolina and Pennsylvania to Florida and Louisiana.—*S. F. Blake.*

17208. **FORBES, HELENA M. L.** The genus Psoralea Linn. *Bothalia* 3(1) : 116-136. 1930.—Forty-nine spp. of *Psoralea* from South Africa are keyed. Full descriptions of the species are given, as well as data on flowering time and geographical distribution. *P.* **bolusii** (p. 123) and *P.* **royffei** (p. 136), both from Cape Province, are new.—*M. O. Malte.*

17209. **GANDRUP, J.** Een nieuwe interessante vindplaats van Cladopus nymani, H. Möll. [A new interesting habitat of C. nymani.] *Handelingen 5th Nederlandsch-Indisch Natuurwetensch. Congres Soerabaia* 1928: 393-398. 1 pl. 1928.—After a brief survey of the older literature, a new habitat is described, lying farther east in Java than those formerly known. The manner of spreading of this rare species is briefly discussed.—*J. Gandrup.*

17210. **HARMS, H.** Zur Kenntniss von Lysiloma guachapele (H.B.K.) Benth. *Notizbl. Bot. Gart. u. Mus. Berlin-Dahlem* 11(101) : 52-56. 1930.—**PSEUDOSAMANEA** (p. 54), based on *P.* **guachapele** (*Acacia guachapele* H.B.K.,=*Samanea samanigua* Pittier) (p. 54), Ecuador. Included also is *Serianthes* **inopinata** (*Mimosoideae*) (p. 55), from Brazil.—*A. M. Johnson.*

17211. **HARRIS, S. K.** An alpine station for Hieracium aurantiacum. *Rhodora* 32(378) : 113. 1930.—At

5500 ft. altitude on Mt. Washington, New Hampshire. —*S. F. Blake.*

17212. **HEILBORN, OTTO.** On some species of tropaeolum from Ecuador. *Arkiv Bot.* [*Stockholm*] 23(3, No. 9): 1-10. 4 fig. 1931.—List of 6 spp., including: *Tropaeolum pubescens* var. **rotundilobum*** (p. 2); *T.* **glaucum*** (p. 4); *T.* **repandum*** (p. 5), with f. **reniforme*** (p. 5); *T. stipulatum** Buch. & Sod., redescribed; *T.* **septemlobatum*** (p. 9).

17213. **IRIGOYEN, L. H., et A. THELLUNG.** Etude sur le Polygonum lapathifolium L. en Amérique du Nord, avec quelques considérations sur cette espèce en Argentine. *Vierteljahrsschr. Naturforsch. Ges. Zürich.* 74(3/4): 244-253. 15 pl. 1929.—A key to the forms of this species is followed by a systematic account, with synonymy and distributional data. *P. lapathifolium* ssp. *nodosum* proles **incarnatum*** (*P. incarnatum* Ell.) (p. 247); *P. l.* ssp. *n.* proles st. **johnii*** (p. 248), Quebec and Nova Scotia; *P. l.* ssp. *n.* proles **vernicosum*** (*P. persicaria* var. *v.* Cham. & Schlecht.) (p. 248); *P. l.* ssp. *n.* proles **lanceifolium*** (Danser), n. comb. (p. 249); *P. l.* ssp. *n.* proles **semilatum*** (Danser), n. comb. (p. 250); *P. l.* ssp. *n.* proles **eurybelonum*** (Danser), n. comb. (p. 250); *P. l.* ssp. *tomentosum* proles **lonchophyllum*** (Danser), n. comb. (p. 250); *P. l.* ssp. *t.* var. **euryphyllum** (Danser), n. comb. (p. 251); *P. l.* ssp. *mesomorphum* proles **semilanceifolium*** (Danser), n. comb. (p. 251).

17214. **JACOT, ARTHUR PAUL.** A new Lepidium from north China. *Rhodora* 32(374): 28-30. 1930.—*Lepidium* **chitungense** (p. 29), from Tsinan, Shantung. —*S. F. Blake.*

17215. **JOHANSSON, K.** Växtgeografiska spörsmål rörande den svenska Hieraciumfloran. II. [Plant-geographical questions in regard to the Swedish Hieracium flora. II.] *Svensk Bot. Tidskr.* 20(3): 306-343. 13 maps. 1926.—Studies on the ranges of the spp. of the *Vulgatiforma* section of *Hieracium*, in the lowlands of Sweden, are reported, and factors governing their distribution are discussed. The following are described: *H.* **phaeodermum** Joh. & Sam. (p. 336), Sweden; *H.* **tjaelderense** Joh. (p 337), Gotland.

17216. **KNOWLTON, CLARENCE HINCKLEY.** Note on Aster amethystinus. *Rhodora* 32(381): 185-186. 1930. —Found by the writer on two occasions, Massachusetts and Vermont, in both cases in company with *A. novae-angliae* and *A. multiflorus*, the putative parents.—*S. F. Blake.*

17217. **KNUTH, R.** Geraniaceae novae. Decas 3 et 4. *Rep. Spec. Nov. Reg. Veg.* 28(751/755, paper 1): 1-10. 1930.—These species come from several collectors, notably the Field Museum expeditions, and are from Peru unless otherwise noted. *Geranium* **herrerae** (p. 1); *G.* **digitatum** (p. 1); *G.* **paludosum** (p. 2), Colombia; *G.* **razuhillcaense** (p. 2); *G.* **schultzei** (p. 2), Colombia; *G.* **pallidifolium** (p. 3) and *G.* **chaparense** (p. 4), Bolivia; *G.* **scissum** (p. 4); *G.* **chinchense** (p. 4); *G.* **matucanense** (p. 5); *G.* **shensianum** (p. 5) and *G.* **lauschanense** (p. 6), China; *G.* **totorense** (p. 7) and *G.* **fuscicaule** (p. 7), Bolivia; *G.* **killipii** (p. 8), Colombia; *G.* **huantense** (p. 8); *G.* **choimacotense** (p. 9); *G.* **raimondii** (*G. canescens* Wedd. not l'Hér.) (p. 9); *G.* **caucense** (p. 9), Colombia; *G.* **lignosum** (§ **FRUTICULOSAE** n. sect.) (p. 10), Colombia.—*H. K. Svenson.*

17218. **LECOMTE, HENRI.** Sur un Dalbergia de Madagascar. *Bull. Mus. Nation. Hist. Nat.* [*Paris*] 1(2): 159. 1929.—*Dalbergia* **obtusa** (*D. retusa* H. Bn., not Hemsley).

17219. **LUIZET, D.** Saxifraga maireana Luizet, sp. nov. *Bull. Soc. Hist. Nat. Afrique du Nord* 20(8): 166-170. 1 fig. 1929.—*S.* **maireana*** (p. 166), Morocco.

17220. **McLAUGHLIN, WILLARD T.** Preliminary reports on the flora of Wisconsin. XIV. Hypericaceae. *Trans. Wisconsin Acad. Sci., Arts and Lett.* 26: 281-288. 11 maps, 2 fig. 1931.—A list of 11 spp. of *Hypericum*, with key, notes on status and habitat, and maps showing distribution within the state. The distribution of *H. kalmianum* is shown to be correlated with that of the glacial Great Lakes.

17221. **MARKGRAF, FR.** Neue Apocynaceen aus Südamerika III. *Notizbl. Bot. Gart. u. Mus. Berlin-Dahlem* 10(100): 1033-1039. 1930.—**RHIPIDIA** (p. 1033), based on *R.* **amazonica** (*Anechites ? a.* Mgf.); *Tabernaemontana* **maxima** (p. 1036); *T.* **stenantha** (p. 1037); *Malouetia* **lata** (p. 1037); *Prestonia* **plumierifolia** (p. 1038); *Forsteronia* **brevifolia** (p. 1038). New species all from northern Brazil.—*A. M. Johnson.*

17222. **MATTFELD, JOH.** Eine baumförmige Espeletia aus der Sierra Nevada de Santa Marta. *Notizbl. Bot. Gart. u. Mus. Berlin-Dahlem* 10(97): 702-705. 1 fig. 1929.—*Espeletia* **glossophylla*** is a tree-like species characteristic of the "Paramos" of Colombia, at altitudes of 3200-4000 meters. It is distinguished from *E. grandiflora*, *E. neriifolia*, and *E. bonplandiaefolia*. It is used by the Indians for building material and clothing.—*A. M. Johnson.*

17223. **MELCHIOR, H.** Der Kokop-Baum von Neu-Mecklenburg (Ailanthus peekelii spec. nov.). *Notizbl. Bot. Gart. u. Mus. Berlin-Dahlem* 10(99): 893-896. 1930. —*Ailanthus* **peekelii** (p. 893) (Simaroubaceae) is a tall tree (40-60 meters) from the New Mecklenburg region of the Bismarck Archipelago, where it is widely distributed and yields timber and other materials to the natives.—*A. M. Johnson.*

17224. **MELCHIOR, H.** Decaphalangium, eine neue Gattung der Guttiferen aus Peru. *Notizbl. Bot. Gart. u. Mus. Berlin-Dahlem* 10(99): 946-950. 1930.—**DECAPHALANGIUM** (p. 946), based on *D.* **peruvianum*** (p. 947), tropical Peru, belongs to the subfamily Clusioideae, being closest to the genus *Allanblackia* of tropical Africa. —*A. M. Johnson.*

17225. **METCALF, FRANKLIN P.** Notes on Chinese plants. *Jour. Arnold Arboretum* 12(4): 270-275. 1931. —Included are: *Desmodium* **dunnii** Merrill (*Lespedeza lanceolata* Dunn, not *D. lanceolatum* Walp.) (p. 270); *Spondias* **chinensis** (*Poupartia c.* Merrill) (p. 270); *Bredia amoena* Diels (=*B. chinensis* Merrill); *Schefflera delavayi* var. *ochrascens* Hand.-Mazz. (=*S. discolor* Merrill); *Xylosma congestum* var. **kwangtungensis** (p. 272); *Vaccinium mandarinorum* Diels (=*V. hangchouense* (Mats.) Komatsu); *V. m.* vars. **laetum** (*V. l.* Diels) (p. 274) and **austrosinense** (*V. donianum* var. *a.* Hand.-Mazz.); *Xolisma ovalifolia* var. **hebecarpa** (*Pieris o.* var. *h.* Franch.) (p. 275). There are also notes on *Desmodium floribundum* (D. Don) Sweet and on *Vaccinium donnianum* Wight.—*A. Rehder.*

17226. **MILDBRAED, J.** Acanthaceae novae. *Notizbl. Bot. Gart. u. Mus. Berlin-Dahlem* 11(101): 62-71. 1930. —*Barleria* **megalosiphon** (p. 62), Rhodesia; *Crossandra* **usambarensis** (p. 63), Usambara, East Africa; *Aphelandra* **arnoldi** (p. 63), Colombia; *A.* **eurystoma** (p. 64), Peru; *A.* **rigida** Glaziou (p. 65), Brazil; *A.* **viscosa** (p. 66), Peru; *A.* **weberbaueri** (p. 67), Peru; *Encephalosphaera* **lasiandra** (p. 68), western Brazil; *Pseuderanthemum* **weberbaueri** (p. 68), Peru; *Beloperone* **bracteosa** (p. 69), Colombia; *B.* **chaetocephala** (p. 70), Colombia. —*A. M. Johnson.*

17227. **MÖRNER, CARL TH.** Exposé över Oxytropis deflexa Pall. som skandinavisk växt. [O. deflexa as a Scandinavian plant.] *Svensk Bot. Tidskr.* 20(3): 344-351. 1926.—Topographical notes on "Habatvuoppebakte" Mt., inner "Finmarken" [Norway], the European locality for *O. deflexa*. Flowering time is apparently July. The color of the flower is discussed. The plant has an Asiatic and a North-American distribution.

17228. **PELLEGRIN, FRANÇOIS.** Plantae Letestuanae novae ou plantes nouvelles récoltées par M. Le Testu, de 1907 à 1919 dans le Mayombe congolais. *Bull. Mus. Nation. Hist. Nat.* [*Paris*] 1(2): 160-162. 1929.—Euphorbiaceae: *Maesobotrya* **tsoukensis** (p. 160). Moraceae: *Dorstenia* **le-testui** (p. 161); *D.* **nyangensis** (p. 161). Artocarpeae: *Trymatococcus* **oligogyna** (p. 162). All from French Equatorial Africa.

17229. **PILGER, R.** Einige neue Santalaceae aus Südamerika. *Notizbl. Bot. Gart. u. Mus. Berlin-Dahlem* 10(100): 1029-1032. 1930.—*Arjona* **schumanniana** (p. 1029), Uruguay and southern Brazil; *Quinchamalium* **brevistaminatum** (p. 1030), *Q.* **lomae** (p. 1030), *Q.* **hoppii**

(p. 1030), *Q.* **elongatum** (p. 1031), *Q.* **raimondii** (p. 1031) and *Q. procumbens* Ruiz and Pav., all from Peru. —*A. M. Johnson.*

17230. **RAUP, H. M. A new species of Salix from the Mackenzie Basin.** *Rhodora* 32(378): 111-112. 1 pl. 1930.—*Salix* athabascensis* (p. 111), Alberta.—*S. F. Blake.*

17231. **NOVÁK, FRANT. A.** Monografická studie o Dianthus gratianopolitanus Vill. [Monographic study of D. gratianopolitanus.] *Spisy Vydávané Přírodovědeckou Fak. Karlovy Univ. v Praze* 51: 1-30. 1 map, 5 fig. 1926.—Discusses *Dianthus gratianopolitanus*, giving geographical distribution and evolution, citing postglacial localities. Formae *typicus, montanus* Gaudin, *laxus* Tausch, *serotinus* Geisenheyer, *incisus* Reichenbach and a hybrid, *D. domini*, are described. A map shows the distribution.—*F. A. Novák.*

17232. **St. JOHN, HAROLD. A revision of the loco-weeds of Washington.** *Proc. Biol. Soc. Washington* 41 (6): 97-106. 1928; issued also as *Contr. Bot. Dept. State College Washington* No. 12.—An historical account is given of the discovery and classification of the species of loco-weed, *Oxytropis* (*Aragallus*), in the state of Washington. A key to the known species is included. New species are: *Oxytropis* **columbiana** (p. 100), *O.* **mazama** (p. 101), *O.* **okanoganea** (p. 102), *O.* **olympica** (p. 103), *O.* **cascadensis** (p. 105).—*H. St. John.*

17234. **SCHULZ, O. E. Amerikanische Cruciferen verschiedener Herkunft.** *Notizbl. Bot. Gart. u. Mus. Berlin-Dahlem* 10(96): 558-564. 1929.—Included are: *Cardamine ovata* v. **unijuga** (p. 557), Colombia; **CATADYSIA** (p. 558), based on *C.* **rosulans** (p. 559), Peru; *Draba* **philippi** (*Eudema thlaspiformis* Phil.) (p. 559), *D.* **sanctae-martae** (p. 560), Colombia; *D.* **schultzei** (p. 560), Colombia; **GRAMMOSPERMA** based on *G.* **dusenii** (p. 562), Patagonia; *Mathewsia* **peruviana** (p. 562), Peru; *Sarcodraba* **andina** (p. 563), Argentina; *S.* **herzogii** (p. 563), Bolivia; *Dryopetalon* **palmeri** (*Cardamine p.* S. Wats.).—*A. M. Johnson.*

17235. **SEYMOUR, FRANK C. A Callitriche new to Massachusetts.** *Rhodora* 32(373): 15-16. 1930.—*Callitriche deflexa* A. Br. var. *austini* (Engelm.) Hegelm., from Mt. Toby.—*S. F. Blake.*

17236. **SKOTTSBERG, C. Artemisia, Scaevola, Santalum, and Vaccinium of Hawaii.** *Bernice P. Bishop Mus. Bull.* 43. 1-89. 8 pl., 30 fig. 1927.—A taxonomic and distributional account of the genera listed. Included are: *Artemisia* **hillebrandii*** (p. 10); *A.* **mauiensis*** (*A. australis β m.* Gray) (p. 15), Latin description; *Scaevola* **cerasifolia** (p. 36); *Vaccinium* **berberidifolium** (*V. penduliflorum* var. *b.* Gray) (p. 79); *V.* **peleanum** (*V. reticulatum* Smith, *integrifolium* Gray) (p. 83); *V.* **pahalae*** (p. 77); *Artemisia hillebrandii* var. **kauaiensis*** (p. 13); *Scaevola chamissoniana* var. **hitchcockii*** (p. 23); *S. procera* var. **pseudomollis*** (p. 35) with f. **macrocalyx*** (p. 36); *S. gaudichaudiana* var. **stenolithos** (p. 27); *S. g.* formae **kauaiensis** and **leucocarpa** (p. 27); *Santalum ellipticum* var. **litorale*** (*S. freycinetianum* var. *l.* Hillebr.) (p. 55); *S.* **cuneatum*** (*S. f.* var. *c.* Hillebr.) (p. 56); *S. c.* var. **gracilius*** (p. 59); *Vaccinium dentatum* var. **argutidens*** (p. 76). Amplified descriptions are given of: *Scaevola chamissoniana* Gaud. and its varieties *bracteosa* and *cylindricarpa*; *S. gaudichaudiana* Cham.; *S. menziesiana* Cham.; *S. coriacea* Nutt.; *S. procera* Hillebrand; *Santalum pyrularium* A. Gray; *S. ellipticum* Gaud.; *Vaccinium calycinum* Smith; *V. dentatum* Smith. Descriptions are accompanied by keys.—*H. T. Darlington.*

17237. **SMITH, C. A. Nuxia and Lachnopylis in Africa.** *Kew Bull. Misc. Inform.* 1930(1): 10-32. 2 pl. 1930.—*Nuxia* Lam., genotype *N. verticillata* Lam., with emended descriptions; *Lachnopylis* Hochst., with an emended description, genotype *L.* **congesta** (*Nuxia c.* R. Br. ex Fres.) (p. 17). **LAXIFLORAE** n. series (p. 16): *L.* **floribunda** (*Nuxia f.* Benth.) (p. 17; 25); *L.* **pubescens** (*N. p.* Sond.) (p. 17; 29); *L.* **emarginata** (*N. e.* Sond.) (p. 19; 28), with var. **brevifolia** (*N. congesta* var. *b.* Sond.) (p. 28); *L.* **tomentosa** (*N. t.* Sond.) (p. 17; 30); *L.* **breviflora** (*N. b.* S. Moore) (p. 17; 30); *L.* **heterotricha** (p. 28), Southern Bechuanaland; *L.* **viscosa** (*N. v.* L. S. Gibbs) (p. 17); *L.* **sambesina** (*N. s.* Gilg) (p. 17); *L.* **speciosa** (p. 29), Natal; *L.* **saxatilis** (p. 27), Natal. **GLOMERULATAE** n. series (p. 16): *L.* **gracilis** (*N. g.* Engl.) (p. 17; 24); *L.* **glomerulata** (p. 24), Transvaal; *L.* **polyantha** (*N. p.* Gilg) (p. 18); *L.* **suaveolens** (p. 23), Transvaal. **SPHAEROCEPHALAE** n. series (p. 18): *L.* **sphaerocephala** (*N. s.* Bak.) (p. 18); *L.* **terminalioides** (*N. t.* Bak.) (p. 18); *L.* **pachyphylla** (*N. p.* Baker, pro maj. parte) (p. 18); *L.* **visciduloso** (p. 27); *L.* **schistotricha** (p. 30) and *L.* **montana** (p. 31), all Transvaal. A short sketch is given of the possible line of evolution in the inflorescence found in the 3 series noted, along with a key to the South African species of Lachnopylis, in which the species character of the indumentum of some species is utilised.—*C. A. Smith.*

17238. **[SMOL'ĬANINOVA, L.]** СМОЛЬЯНИНОВА, Л. Обзор литературы по роду **Corylus L. [Survey of the literature on the genus Corylus L.]** Труды по Прикладной Ботанике, Генетике и Селекции (*Bull. Appl. Bot., Gen., Plant-Breed.*) 21(5): 379-450. 11 fig. 1929.—The literature on the genus is reviewed. Geographic distribution is indicated, geological history discussed, cultivation described, and economic importance suggested. Particular reference is also made to experimental data concerning the effect of temperature on cultivation of these plants. The genus comprises 10 spp. (all described), 2 of which are American. Most of the cultivation is in Asiatic Turkey, but some also in southern Europe.—*L. J. Pessin.*

17239. **STANDLEY, PAUL C. The Nyctaginaceae and Chenopodiaceae of northwestern South America.** *Field Mus. Nat. Hist. Bot. Ser.* 11(3): 73-126. 1931.—Treatment based on material in the Field Museum and U. S. Nat. Museum, covering the area of Bolivia, Ecuador, Colombia, and Venezuela, and including about 16 genera and 73 spp., with keys to genera as well as species of the larger genera. Nyctaginaceae: *Neea* **woronovii** (p. 77), Colombia; *N.* **mapirensis** (p. 78) and *N.* **dimorphophylla** (p. 78), Bolivia; *N.* **brittonii** (*N. macrophylla* Britton, non Poepp & Endl.) (p. 80); *N.* **boliviana** (p. 81), Bolivia; *Torrubia* **floribunda** (*Pisonia f.* Hook. f.) (p. 85); *T.* **rusbyana** (*Pisonia r.* Heimerl in herb.) (p. 85), Venezuela; *T.* **pubescens** (*Pisonia p.* HBK.) (p. 86); *T.* **uberrima** (p. 88), Colombia; *Salpianthus* **pyriformis** (*Cryptocarpus p.* HBK.) (p. 95); *Boerhaavia coccinea* v. **leiocarpa** (*B. paniculata* f. *l.* Heimerl) (p. 108); *Mirabilis* **expansa** (*Calyxhymenia e.* R. & P.) (p. 113). Chenopodiaceae: *Chenopodium macrospermum* v. **halophilum** (*C. h.* Phil.) (p. 118); *Atriplex* **asplundii** (p. 125), Bolivia; *A.* **herzogii** (*A. serpyllifolia* Herzog, non Bunge) (p. 125).

17240. **STEBBINS, G. L. Jr. An interesting form of Eupatorium perfoliatum.** *Rhodora* 32(379): 132-133. 1930.—*Eupatorium perfoliatum* f. **laciniatum** (p. 133), Westport, Massachusetts.—*S. F. Blake.*

17241. **STEWARD, ALBERT N. The case for Polygonum cuspidatum Sieb. & Zucc.** *Rhodora* 32(383): 223-225. 1930.—Is proper name for the species, the previous use of the same name by Willdenow being only in synonymy, as is also the case of the substitute name *P. sieboldii* De Vriese.—*S. F. Blake.*

17242. **THACKERY, FRANK A., and M. FRENCH GILMAN. A rare parasitic food plant of the southwest.** *Ann. Rept. Smithsonian Inst.* 1930: 409-416. 9 pl. 1931.—

(2 spp.), *Sarcorhachis* (2), *Piper* (290), and *Peperomia* (140). The previously described species are listed with synonymy, type locality, general range, and citation of Costa Rican exsiccatae. The following are proposed: *Sarcorhachis* anomala (p. 118); *Piper* pertractatum (p. 130); *P.* magnifolium (*P. pseudo-lindenii m.* D. DC.) (p. 131); *P.* compactum (p. 131); *P.* tilaranum (p. 131); *P.* adenophlebium (p. 132); *P.* xanthoneurum (p. 132); *P.* venulosum (p. 132); *P.* recuperatum (p. 132); *P.* dissimulans (p. 133); *P. san-josecanum* v. minor (p. 133); *P.* corozalanum (p. 134); *P.* obumbratifolium (p. 134); *P.* longepetiolatum (*P. geniculatum l.* D. DC.) (p. 134); *P.* seductum (p. 135); *P. prismaticum* magnifolium (*P. turrialvanum m.* C. DC.) (p. 135); *P. p.* v. tilaranum (p. 135); *P. p.* v. villosulum (p. 135); *P.* cyanophyllum (p. 136); *P.* arcte-acuminatum (p. 136); *P. irazuanum* v. suborbiculatum (p. 137); *P. candelarianum* angustatum (*P. sepium glabrum* C. DC., not *P. glabrum* Mill.) (p. 137); *P. c.* sepium (*P. s.* D. DC.) (p. 137); *Piper* cuspidispicum (p. 138); *P.* viridispicum (p. 138); *P.* pachystylum (p. 139); *P.* viridifolium (p. 139); *P.* annulatum (p. 139); *P.* labeculatum (p. 139); *P.* jubatum (p. 140); *P.* altevaginans (p. 140); *P.* pexum (p. 140); *P.* operosum (p. 140); *P.* subsericeum (p. 140); *P.* detonsum (p. 141); *P.* impube (p. 142); *P.* figlinum (p. 142); *P.* tarrazuense (p. 142); *P.* subzhorquinense C. DC. in herb. (p. 142); *P.* orosianum (p. 143); *P.* arcessitum (p. 143); *P. tonduzii* v. semiherbaceum (p. 143); *P.* aereum (p. 144); *P.* deflexispicum (p. 144); *P.* escasuense (p. 144); *P.* tacamahaca (p. 144); *P.* subvariabile (p. 145); *P.* caeruleifolium (p. 145); *P.* omega (p. 146); *P.* aragonense (p. 146); *P.* perpuberulum (p. 146); *P.* cercidiphyllum (p. 146); *P.* falcigerum (p. 147); *P.* sublaevifolium (*P. laevifolium* C. DC., not *P. l.* Blume) (p. 147); *P.* sinuatifolium (p. 147); *P.* tortuosipilum (p. 148); *P.* gracilipedunculum (p. 148); *P.* surubresanum (p. 148); *P.* opacibracteum (p. 148); *P.* unguiculiferum (p. 149); *P.* copeyanum (*P. pulchrum c.* C. DC.) (p. 149); *P.* pseudo-glabrifolium (p. 150); *P.* pacacanum (*P. nobile minus* C. DC.) (p. 150); *P.* escuadranum (p. 150); *P.* irrasum (p. 151); *P.* palmanum (p. 151); *P.* aserrianum (p. 151); *P.* cincinnatum (p. 151); *P.* clavuliger (p. 151); *P.* signatum (p. 152); *P.* ciliatifolium (p. 153); *P.* bullulaefolium (p. 152); *P.* tinctum (p. 153); *P.* pentagonum (p. 153); *P.* pseudo-fimbriulatum (p. 153); *P.* exiguispicum (p. 153); *P.* perlongipes (p. 154); *P.* auritifolium (p. 154); *P.* mirabile (p. 154); *P.* evasum (p. 55); *P.* longevillosum (p. 155); *P.* auriculiferum (p. 156); *P.* insolens (p. 156); *P.* disparifolium (p. 156); *P.* celatipetiolum (p. 156); *P.* vicinum (p. 157); *P.* pelliticaule (p. 157); *P.* anisophyllum (*P. dilatatum acutifolium* C. 17245. WENT, F. A. F. C. Untersuchungen über Podostemonaceen. III. *Verhandl. Kon. Akad. Wetensch. Amsterdam. Afd. Natuurk. 2 Sectie* 25(1): 3-59. 11 pl. 1926.—The author studied living Podostemonaceae near the Raleigh Falls of the Coppename river in Surinam (Dutch Guiana). The species studied were *Apinagia* nana (p. 31), *A.* flabellifera (*Oserya f.* Tul. & Wedd.) (p. 36), *A. perpusilla, Mourera fluviatilis, Oenone richardiana, O.* staheliana (p. 14), *O. versteegiana, O. marowynensis* and *Tristicha hypnoides. Mourera* revealed itself as rootless; it fastens with hapters, which morphologically are not roots. Formation of starch in the sun could be proved by Sachs' iodine experiment. Assimilating parts are very hairy, the hairs being moved to and fro by the current and probably serving as absorbing organs. As soon as the water of the river is lowered, flowering sets in. Flower buds are ready a long time beforehand, but elongation begins only when dryness sets in. Pollination by distinct bees is described. The mechanical tissue in the flower stalks and stems is first collenchyma, and after drying up is changed into sclerenchyma. At the same time the superficial tissue of these organs is cast off in the living state (the cells may be plasmolysed). These cell-walls shrink, which they do not do so long as they are in connection with other tissues. The development of the embryo sac and egg-apparatus was identical with that described earlier by the author. In an appendix the author gives investigations on the embryo sac of a Javanese species, *Cladopus nymani*, by one of his former students, Miss F. BEUCKER ANDREAE, who left these notes after her early death. Here also the development follows the same course, contrary to published statements by Werner Magnus for some of the Podostemonaceae from India and Ceylon. A short investigation of some other Surinam rivers showed that there are some species which may be found in any river, such as *Mourera fluviatilis*, whereas others are localised in one river in definite horizontal zones, where some species in one river may represent a different one in another river. It is suggested that in the course of time 2 different lines of development have been followed by the species of this family: one leading to the large rootless forms of tropical America, the other through Africa to Ceylon and India leading to forms with roots enormously developed but shoots reduced. *Tristicha* having the same development of the embryo sac as the other species, there seems to be no reason for following Willis and establishing a separate family of Tristichaceae for this genus.—*F. A. F. C. Went.*

17246. WILLIAMSON, H. B. Notes on some Victorian Acacias. *Victorian Naturalist* 46(10): 198-200. 1930.—A review of the Victorian representatives of *Acacia*, sections *Bipinnatae* and *Juliferae*, with notes on distribution and specific distinctions. 17250. EWER, S. JUDSON. Notes on Katahdin plants. *Rhodora* 32(384): 259-261. 1930.—Records 23 species and varieties not previously recorded from Mt. Katahdin, Maine, including *Salix arctophila* Cockerell and *Aster puniceus* var. *perlongus* Fernald, new to New England. —*S. F. Blake.*

17251. FASSETT, NORMAN C. Notes from the herbarium of the University of Wisconsin—V. *Rhodora* 32 (375): 57-59. 1930.—Records of *Scirpus heterochaetus, Echinochloa walteri, Galium boreale* var. *typicum,* and *Bidens coronata.—S. F. Blake.*

17252. FOGG, JOHN M. Jr. A few noteworthy plants from Falmouth, Massachusetts. *Rhodora* 32(378): 103-110. 1930.—Annotated list of various species, mostly characteristic of the mainland rather than the coastal plain. —*S. F. Blake.*

17253. FRIES, ROB. E., und TH. C. E. FRIES. Beiträge zur Kenntnis der Flora des Kenia, Mt. Aberdare und Mt. Elgon XII. *Notizbl. Bot. Gart. u. Mus. Berlin-Dahlem* 10(96): 594-621. 1929.—This is a list of plants, with notes on distribution, additional to the flora of the districts named in the title. The species fall to the following families: Gramineae by R. PILGER.—13 genera, 32 spp.; Rubiaceae by K. KRAUSE and W. ROBYNS.—22 genera, 61 spp., 1 variety; Piperaceae by R. E. FRIES,—3 genera, 8 spp.; Proteaceae by R. E. FRIES,—2 genera, 3 spp.; Sterculiaceae by T. C. E. FRIES,—1 genus, 3 spp.; Combretaceae by T. C. E. FRIES.—1 genus, 4 spp. New to science are: Gramineae: *C.* papillipes (*Hyparrhenia p.* Hochst.) Pilger (p. 597); *Cymbopogon* (*Hyparrhenia*) micrantherus Pilger (p. 596). Rubiaceae: *Mussaenda* keniensis K. Krause (p. 603); *Randia* fratrum K. Krause (p. 604); *Pavetta* friesiorum K. Krause (p. 606); *Anthospermum* aberdaricum K. Krause (p. 609); *Rytigynia* friesiorum Robyns (p. 614); *Canthium* rubrocostatum Robyns (p. 616).—*A. M. Johnson.*

17254. FRIES, ROB. E., und TH. C. E. FRIES. Beiträge zur Kenntnis der Flora des Kenia, Mt. Aberdare und Mt. Elgon XIII. *Notizbl. Bot. Gart. u. Mus. Berlin-Dahlem* 10(99): 897-917. 1930.—A conspectus of the species, etc., of the ranunculaceous genera *Delphinium, Ranunculus, Anemone, Clematis,* and *Thalictrum* from Kenia. Described by E. ULBRICH as new to science are: *Ranunculus* helogeton (p. 901); *R.* elgonensis (p. 902); *R.* aberdaricus (p. 904); *R. oreophytus* vars. genuinus (p. 906), gunae (*R. g.* Schweinf.) (p. 907), and stolonifer (p. 908); × *Ranunculus* fratrum (p. 912) (*R. oreo-*

phytus Del. × *pubescens* Thbg.); *Clematis* friesiorum (p. 914); *Thalictrum* stolzii (p. 916); *Anemone thomsonii* var. friesiorum (p. 900).—*A. M. Johnson.*

17255. **GILLIAT-SMITH, B., and W. B. TURRILL.** On the flora of the Nearer East. A contribution to our knowledge of thhe flora of Azerbaidjan, N. Persia. VI, VII, VIII, IX. *Kew Bull. Misc. Inform.* 1930 (7/8/9/10): 273-313, 375-401, 427-465, 480-493. 1930.—This paper is based on more than 4 years' field experience and the taxonomic and phytogeographical analysis of 1370 herbarium specimens of 699 spp. and 31 additional varieties. An account is given of the topography, geology, and climate of Persian Azerbaidjan and of previous botanical exploration in the province. Field studies are summarized, and a phytogeographical analysis leads to the conclusion that the flora of Azerbaidjan is Mediterranean-Oriental and that its closest affinities are with Armenia and Transcaucasia to the north and northwest and not with central and south Persia. A full systematic enumeration of the collection includes taxonomic and distributional notes, vernacular names, field observations etc. The following are described: *Delphinium divaricatum* var. gilliatii (p. 290); *Papaver somniferum* var. collinum (p. 295); *Alyssum campestre* var. compactum (p. 297); *Sterigmostemum tomentosum* var. subintegrum (p. 304); *Tribulus terrestris* var. grandiflora (p. 375); *Astragalus* distantior (p. 377); *A.* glabristylus (p. 378); *A.* mishouensis (p. 379); *A.* phaulanthus (p. 380); *A.* sirensis (p. 382); *Achillea* sahandica (p. 396); *Centaurea* albonitens (p. 427); *Cousinia microcephala* var. glabrescens (p. 431); *Jurinea macrocephala* var. glabrescens (p. 434); *Campanula* gilliatii Milne-Redhead et Turrill (p. 439); *Acantholimon* gilliatii (p. 441); *A.* yamense (p. 442); *Androsace maxima* var. flavida Gilliat-Smith (p. 443); *Linaria lineolata* var. latifolia (p. 449); *Scrophularia alata* var. pubescens (p. 450); *Salvia* gilliatii (p. 456); *Plantago loeflingii* var. longistyla (p. 461); *Halanthium rariflorum* var. sanguineum (p. 463). Unless otherwise indicated, new names are by Turrill.—*B. Gilliat-Smith and W. B. Turrill.*

17256. **GRAVES, ARTHUR HARMOUNT.** Important woody plants—trees, shrubs, and woody climbers—of Greater New York. *Brooklyn Bot. Gard. Leaflets* 19 (2/3): 1-8. 1931.—The list, including exotic species common in cultivation, was prepared on the request of the committee on requirements for the examination of candidates for teaching licenses for junior and senior high school biology in New York City. It is one of several lists of natural objects (wild flowers, birds, reptiles, etc.) being added to the requirements in order that natural history may be given a larger emphasis in biology instruction in the New York City high schools.—*A. H. Graves.*

17257. **HISAUCHI, KIYOTAKA.** Botanical notes from the Tochûken. IV-IX. [In Japanese.] *Jour. Japanese Bot.* 3 (9): 240-242. 1926; 4 (4): 102-104. 1927; 5 (3): 122-126. 1 pl., 2 fig. 1928; (5): 200-202. 1928; (9): 340-346. 4 fig. 1928.

17258. **JÁVORKA, SÁNDOR, és VERA CSAPODY.** A Magyar Flóra Képekben (Iconographia florae Hungaricae). Füzet 8. 3 pl. (2 col.), fig. 1673-1867. K. Magyar Természettudományi Társulat: Budapest, 1931.—Plates and figures with descriptions.

17259. **KENNEDY, R. B.** Some additions to the Newfoundland flora. *Rhodora* 32 (373): 3-4. 1930.—Records of *Hydrocotyle americana* L., *Anemone riparia* Fernald, *Impatiens pallida* Nutt., *Potamogeton subnitens* Hagström, *Lotus corniculatus* L., and *Crepis biennis* L., all new to Newfoundland.—*S. F. Blake.*

17260. **[PASTERNATSKAÏA, V. F.]** ПАСТЕРНАЦКАЯ, В. Ф. Ботанико-географическое исследование в долине р. Лашипсе в Абхазии. [Phytogeographic studies in the Lashipse River Valley in Abkhasia, Caucasus.] (German summary.) Журнал Науково-Дослідчих Катедр м. Одеси (*Ber. Wiss. Forsch.-Inst. Odessa*) 2 (4): 12-20. 4 fig. 1926.—The vegetation is similar to that of the western Transcaucasian region, herbaceous plants predominating, with few arborescent spp. of *Alnus, Fraxinus, Carpinus* and *Fagus*. On the higher slopes, oak and red and silver fir occur. On the lime formations pine replaces the fir and *Arctostaphyllos* occurs. Notes are given extending the known ranges of a few species. *Rhamnus frangula* var. abchasica (p. 17) is new.—*E. D. Merrill.*

17261. **PEASE, ARTHUR STANLEY.** Botanical notes from northern Vermont. *Rhodora* 32 (374): 17-18. 1930.—Records of various spp., including *Linum catharticum* L. at Holland, here first reported from the interior of New England.—*S. F. Blake.*

17262. **QVARFORT, S.** Kärlväxtfloran på Runmarö. [Flora of Runmarö, Sweden.] *Svensk Bot. Tidskr.* 25 (1): 36-76. 2 maps, 6 fig. 1931.—The paper is a short description of the flora, with respect to the phanerogams and pteridophytes, of the isle Runmarö in the Stockholmian archipelago of the Baltic sea. This island, of about 15 square kilometres, bears a rich vegetation, growing upon limestone; in this it is similar to the island of Gotland, also in the Baltic sea. Runmarö has 22 spp. of Orchidaceae, which in proportion to its area is more than any other place in Sweden. Many extension limits of Scandinavian plants pass through the isle, both of northern and southern spp. The botanical exploration, begun as late as 1876, can now be regarded as practically completed, and the list shows 701 spp., excluding *Rosa, Taraxacum* and *Hieracium*, which are not yet fully examined. Including the flora of the adjacent islands (within parentheses in the list), the number rises to 731, but 12 spp. of *Taraxacum* and 34 of *Hieracium* are cited. A list of papers dealing with the flora of Runmarö up to 1929 is added.—*S. Qvarfort.*

17263. **RICKETT, H. W.** Flora of Columbia, Missouri. *Univ. Missouri Studies* 6 (1): 3-84. 1931.—This is essentially a revision of Daniels' "Flora of Columbia, Missouri, and Vicinity" (1907); 20 genera and 63 spp. not found in the above work have been added, including 19 Pteridophyta, 2 Gymnospermae, and Angiospermae. A list of the families, with the number of genera and species of each represented, is given. *Vernonia baldwini* v. parthenioides (*V. p.* Daniels) (p. 81) is a provisional n. comb.

17264. **SĂVULESKU, TR., si T. RAYSS.** Materiale pentru flora basarabiei. Part 2. *Supl. Bul. Agric.* [*Bucuresti*] 3: 81-230. 13 pl., 35 fig. 1926.—The second part of the Bessarabian flora, beginning with the Betulaceae and ending with the Frankeniaceae, includes 340 spp. and many varieties. The distribution of every species in Bessarabia is noted. Detailed descriptions of some more interesting species and varieties with figures, e.g., varieties of *Quercus lanuginosa** (Lam.) Thuill., *Q. sessilis** Ehrh., *Q. lanuginosa* × *sessilis**, *Q. robur** L., *Rumex* spp., *Euphorbia* spp. with a key; *Obione verrucifera** Mogn. Tend. and *O. portulacoides** Mogn. Tend., with a key to separate them; *Camphorosma monspeliaca* L., *C. annua** Pell. and *ovata** W.K., *Petrosimonia* spp., *Dianthus rehmani* Blocki and *leptopetalus** Willd., *Syrenia* spp., *Alyssum* spp. Plates of: *Populus alba* × *tremula, Salix acutifolia, Rumex acrainicus, Obione verrucifera, camphorosma, monspeliaca, Halocnemum strobilaceum, Petrosimonia brachiata, P. crassifolia, Dianthus leptopetalus, Silene sibirica, Roripa prostrata, Alyssum transilvanicum, Schivereckia podolica.* For some more difficult species are given comparative tables for determination. Included are: *Euphorbia falcata* var. intermedia (p. 120); *Polygonum lapathifolium* ssp. *verum* var. *danubiale* fs. putatum and prutenicum (p. 110); *Silene longiflora* var. *typica* f. abortiva (p. 166); *S. l.* var. *scabra* f. elata (p. 166); *S. cserei* var. pusilla (p. 162); *Melandrium noctiflorum* var. *typicum* f. villosum (p. 168); *Atriplex patula* var. uncinata (p. 125); *Consolida regalis* f. albiflora (p. 172); *Dianthus rehmani* var. *sublanceolatus* f. ramosus (p. 157); *D. r.* var. *thyraicus* f. scaber (p. 157); *D. r.* var. longivaginatus (p. 157); *Ranunculus illyricus* var. speciosus (p. 178); *R. cassubicus* var. incisodentatus (p. 178); *R. polyanthemus* ssp. *eu-polyanthemus* f. parviflorus (p. 179); *Papaver dubium* var. *collinum* f. multicaule (p. 183);

Corydalis cava ssp. *eu-cava* f. **maxima** (p. 184); *C. solida* ssp. *eu-solida* f. **bicaulis** (p. 184); *Chorispora tenella* f. **caespitescens** (p. 212); *Reseda inodora* f. **brevipedicillata** (p. 215); *Myosoton aquaticum* vars. **scandens** (Godr.) S. & R. and **silvaticum** (Schur) S. & R.; *M.* **sarmaticum** (*Stellaria sarmatica* Zapal). 60 plants are new for Bessarabia and 16 are very rare.—*C. Regel.*

17265. **SCHAAF, GUSTAV.** Von der Pflanzenwelt des Schwetzinger Dünenzugs. [Vegetation of the Schwetzingen sandhills, Germany.] *Aus der Heimat* 42(6): 161-172. 15 fig. (3 maps). 1929.—The Schwetzinger range of sandhills and its extension as far as Mainz constitutes, by a combination of temp., precipitation and soil, a phytogeographic island within south Germany. Among plants adapted to dryness and warmth occur especially *Jurinea cyanoides, Kochia arenaria, Helianthemum fumana, Corispermum canescens* var. *marshalli.* Some sands are rich in lime, others lack it. The number of spp. found in lime-sand is less than half the number recorded by Spilger from Darmstadt: *Plantago ramosa, Helianthemum fumana, Jurinea cyanoides, Alyssum montanum.* The difference appears to be due to higher temp. and less precipitation than at Darmstadt. *Allium sphaerocephalum* f. *nodosa* produces a second accessory bulb directly under the surface of the sand, an adaptation to the blowing over of the sand.—*G. Schaaf* (*transl. by J. E. Dinsmore*).

17266. **STEARN, W. T.** Unnecessary changes in nomenclature. A criticism of Dr. Abrams' "Flora of the Pacific States." *Gard. Chron.* [*London*] 88(2290): 410. 1930.—The author deplores the use of certain names by Abrams, who has followed the American Code rather than the International Rules of Botanical Nomenclature.

17267. **TATEWAKI, M.** The vernal vegetation in the vicinity of Cape Erimo and Mt. Apoi, Prov. Hidaka, Hokkaido [Japan]. [In Japanese, with English summary.] *Jour. Soc. Agric. & Forestry, Sapporo, Japan* 19(85): 137-156. 2 pl. 1927.

17268. **WILLIS, J. C., and J. STANLEY GARDINER.** The Percy Sladen Trust Expedition to the Indian Ocean in 1905. XI. Flora of the Chagos Archipelago. *Trans. Linn. Soc. London, Zool.* 19(2): 301-306. 1931.—The authors review previous collections and reports on these isls. in the Indian Ocean. The slow planting of many of the islets is ascribed to the absence of land crabs, which have a way of visiting the shores and dragging inland any flotsam. Plants other than those cultivated number 98, of which 46 are recorded in the Maldives and 65 in the Seychelles, 40 being common to all 3 groups. The number of spp. in the natural flora is estimated by one author at 20-25; by the other at about 49. This flora is chiefly Malayan in composition, owing to the direction of the currents reaching the group. A briefly annotated list of spp. is given, with remarks on distribution, habitat, and economic uses.

PALEOBOTANY

EDWARD W. BERRY, *Editor*

(See also in this issue Entries 15327, 15360, 15378, 15534, 17132, 17280, 17286, 18107)

17269. **BERRY, EDWARD WILBER.** A revision of the flora of the Latah formation. *U. S. Geol. Surv. Prof. Papers* 154. pp. 225-265. 16 pl. 1928(1929).—The author describes the late miocene flora from eastern Washington and discusses the environmental conditions indicated. Particular attention is given to the large number of genera present which the progressive aridity, due to the elevation of the mountains to the westward that intercepted the moisture laden winds from the Pacific, exterminated in this region, and which survived in either southeastern N. America and eastern Asia, or both. Polypodiaceae: *Asplenium* **occidentale***, *Woodwardia* **praeradicans***, and *Woodsia* **bonseri*** (p. 236). Pinaceae: *Pinus* **macrophylla***, *P.* **latahensis***, *P.* **monticolensis*** described from seeds, and *P.* **tetrafolia** (p. 238); *Tsuga* **latahensis*** (p. 239), cone scales, first described in America. Naiadaceae: *Potamogeton* **heterophylloides*** (p. 240). Myricaceae: *Comptonia* **hesperia*** (p. 241). Salicaceae: *Salix*, pistillate flower*, first recorded in association with fossil foliage. Betulaceae: *Alnus* **elliptica***, and *A.* **prerhombifolia*** (p. 244). Fagaceae: *Quercus simulata* Knowlton (=*Q. chaneyi* Knowlton, *Q. praenigra* Knowlton); *Q.* **treleasii*** (p. 247). Moraceae: *Ficus*? *washingtonensis* Knowlton, emended description. Menispermaceae: *Menispermites* **latahensis*** (p. 249). Magnoliaceae: *Liriodendron* **hesperia*** (p. 249), first record of the genus in the Tertiary of N. Amer., described from carpels. Hamamelidaceae: *Liquidambar californicum* Lesquereux, emended descr. (=*L. protensum* Les., *L. europaeum patulum* Knowlton, *L. pachyphyllum* Knowlton, *L. convexum* Cockerell, *L. acutilobum* Chaney). Grossulariaceae: *Ribes* **fernquisti*** (p. 251), first record of the genus as fossil outside Colorado. Rosaceae: *Cercocarpus* **praeledifolius*** (p. 252). Caesalpiniaceae: *Cassia* **sophoroides*** (*Phyllites s.* Knowlton) (p. 253); *C.* **spokanensis*** (p. 253), descr. from fruit. Papilionaceae: *Meibomites* **knowltoni*** (p. 253); *Leguminosites* **bonseri***, *L.* **alexanderi*** (p. 253). Sapindaceae: *Sapindus* **spokanensis*** (*S. angustifolius* Les.) (p. 254); *S.* **armstrongi*** (p. 254). Celastraceae: *Celastrus* **spokanensis*** (p. 254); *Euonymus* **knowltoni*** (p. 255), first record of the genus as fossil in post-Eocene deposits of America. Hippocastanaceae: *Aesculus* **hesperia*** (p. 256). Rhamnaceae: *Rhamnus* **spokanensis*** (p. 257). Tiliaceae: *Tilia* **hesperia*** (p. 258). Malvaceae: *Hibiscus*? **occidentalis*** (p. 258), descr. from seed, first record of the genus as fossil. Ternstroemiaceae: *Ternstroemites* **idahoensis*** (*Myrica*? *i.* Knowlt.) (p. 258). Lauraceae: *Sassafras* **hesperia*** (p. 259); *Umbellularia* **dayana*** (*Salix d.* Knowlt.) (p. 260); *U.* **lanceolata*** (p. 260). Cornaceae: *Cornus* **acuminata*** (p. 260); *Nyssa* **knowltoni*** (p. 261); *N.* **magnifica** (*Carpites m.* Knowlt.) (p. 261). Umbelliferae: **UMBELLIFEROSPERMUM** (p. 261), resembling *Rhodosciadum*, type *U.* **latahense*** (p. 261), descr. from fruit. Ericaceae: *Arctostaphylos* **knowltoni*** (p. 261); *A.* **spatulata*** (p. 262); *Menziesia* **knowltoni*** (p. 262), first record of the genus as fossil. Vacciniaceae: *Vaccinium* **americanum** (*Santalum a.* Les.=*V. salicoides* Knowlt., *Salix pseudoargentea* Knowlt.); *V.* **bonseri*** (p. 262); *V. b.* var. **serrulatum*** (p. 262); *V.* **spokanense*** (p. 263). Apocynaceae: *Apocynophyllum* **latahense*** (p. 263). Convolvulaceae: *Porana* **microcalyx** (*Diospyros*? *m.* Knowlton) (p. 263), emended descr. Caprifoliaceae: *Viburnum* **lantanafolium*** (p. 264); *V.* **fernquisti*** (p. 264), descr. from fruit. Position uncertain: *Carpolithus* **pteraformis*** (p. 264), descr. from fruit. All from Washington.

17270. **BROWN, ROLAND W.** Additions to the flora of the Green River formation. *U. S. Geol. Surv. Prof. Papers* 154. pp. 279-293. 7 pl. 1928(1929).—The author notes previous studies of the flora, and reports 130 certainly identified species now known. Twenty-three genera, new to the Green River (middle Eocene) flora, and having living spp., are recorded. A probable environment is suggested. Additions to the flora include: Thallophyta, Laboulbiliaceae: *Caenomyces* **planerae** (p. 281). Pteridophyta, Schizeaceae: *Aneimia* **delicatula*** (p. 281). Arthrophyta, Equisetaceae: *Equisetum* **winchesteri*** (p. 282). Spermatophyta, Taxaceae: *Taxites* **eocenica*** (p. 282). Pinaceae: *Picea* **pinifructus*** (p. 282). Sparganiaceae: *Sparganium* **eocenicum*** (p. 282). Myricaceae: *Myrica torreyi* Lesquereux; *M. alkalina** Lesq. Juglandaceae: *Hicoria juglandiformis** (Sternberg) Knowlton. Betulaceae: *Betula* **eocenica*** (p. 283). Ulmaceae: *Planera nervosa** Newberry (=*Myrica prae-*

drymeia Knowlton); *Celtis* debequensis* (p. 284). Moraceae: *Ficus mississippiensis* (Lesquereux) Berry; *F.* omballi* (p. 285). Proteaceae: *Lomatia* coloradensis* (*Phyllites c.* Knowlton) (p. 285); *L. acutiloba* Lesq.; *Banksia* cockerelli* (p. 286). Lauraceae: *Oreodaphne* knowltoni* (p. 286). Rosaceae: *Chrysobalanus* lacustris (p. 286). Leguminosae (Mimosaceae): *Mimosites* debequensis* (p. 286), *M.* falcatus*, and *Cassia* hesperia* (p. 287). Malpighiaceae: *Banisteria* bradleyi* (p. 287). Anacardiaceae: *Rhus myricoides** Knowlton (Knowlton's fig. 9 is designated type); *R.* balli* (p. 287); *Weinmannia obtusifolia* Lesq., *W. haydenii* Lesq., and *W. integrifolia* Lesq. are considered not to belong to *Weinmannia; Schmaltzia vexans* (Lesq.) Cockerell; *Anacardites* schinoloxus* (p. 288), described from fruit. Celastraceae: *Celastrophyllum* lesquereuxii* (p. 289); *C.* emarginatum* (p. 289); *Maytenus* berryi* (p. 289). Sapindaceae: *Thouinia* eocenica* (p. 289). Aquifoliaceae: *Ilex affinis* Lesq. Tiliaceae: *Grewiopsis* cissifolius* (p. 290). Sterculiaceae: *Sterculia* coloradensis* (p. 290). Ternstroemiaceae: *Ternstroemites* viridiflumensis* (p. 290). Oleaceae: *Fraxinus* petiolata* (p. 290). Apocynaceae: *Apocynophyllum wilcoxense* Berry; *Apocynospermum* coloradensis* (p. 291). Cucurbitaceae: *Cucurbita* glandulosa* (p. 291). Incertae sedis: *Phyllites* juncoides*, *Carpolithus* cassioides*, *C.* ellipticus*, *C.* capsularis*, and *C.* palmites* (p. 291); *C.* serratifolius*, *Antholithes* vitaciflora*, *A.* dubia*, *A.* polemonioides*, *A.* pendula*, *Caulinites* acanthus*, *C.* prehensus*, *Rhizocaulon* natans*, and *R.* dichotomum* (p. 292). All from Colorado.

17271. HOLLICK, ARTHUR. Records of Triassic fossils on Staten Island, New York, with descriptions of specimens. *Proc. Staten Isl. Inst. Arts and Sci.* 6(1): 5-22. 9 pl. 1931.—The described and figured specimens were obtained from morainal material, thought to have come from eroded Triassic areas in New Jersey. They are the first fossils of this age reported from New York state. Algae, 2 doubtful spp.* of *Chondrites*. Filicales ?: GELLERA (p. 9), compared with *Baiera*, erected for *G.* paradoxa* (p. 9), type in Staten Island Inst. Arts and Sci. Equisetales: *Equisetum rogersii** ? (Bunbury) Schimper, and a possible stem* of *Equisetum*. Coniferales: branch of a conifer*, branch-bud of a gymnosperm* ?, and other coniferous remains*. Amphibia: footprints*.

17272. RICHARDS, HORACE G. The subway tree—a record of a Pleistocene cypress swamp in Philadelphia. *Bartonia* No. 13. 1-6. 1 pl. 1931.—In excavating for a subway in Philadelphia, stumps of *Taxodium distichum* (bald cypress) were found at 38 ft. below the surface and 10 ft. below sea-level. The trees probably grew prior to the last (Wisconsin) glaciation, near the margin of a marine invasion that converted the lower Delaware River into an arm of the sea. It is suggested that the stumps belong in the Cape May formation, and that that formation was deposited in a warmer interglacial period; later the forest was covered by outwash from the Wisconsin glaciation in northeastern Pennsylvania. Comparison is made with a similar find of *Taxodium* in making excavations at Washington, D. C.—*F. W. Pennell.*

17273. ZANON, VITO. Le Diatomee nel periodo Carbonifero. *Atti Pontificia Accad. Sci. Nuovi Lincei* 81 (4): 278-279. 1928.—A note, confirming the report of the existence of diatoms in the Carboniferous.

17274. ZANON, V. Le Diatomee delle ambre Etrusche. *Atti Pontificia Accad. Sci. Nuovi Lincei* 81(6): 364-366. 1928.

PALEOZOOLOGY

(Abstracts of general papers only. Abstracts of systematic and morphological papers are grouped with those of a similar nature treating of living animals.)

B. F. HOWELL, *Editor*

JOHN R. SANDIDGE AND GLEN L. JEPSEN, *Associate Editors*

(See also in this issue Entries (Unclassified) 16456; (Protozoa) 17477, 17479, 17486, 17499, 17501, 17502, 17503, 17505, 17506, 18115; (Coelenterata) 17513, 17514, 17516, 17517, 17564; (Brachiopoda) 17477, 17564, 17565, 17566, 17567; (Echinodermata) 17486; (Bryozoa) 17564, 18115; (Osteostraci) 17931, 17932; (Mollusca) 17486, 17564, 17576, 17580, 17588, 17592, 17596, 17598, 17599, 17601, 17605, 17606, 17607, 17608, 17611, 17612, 18107, 18115; (Crustacea) 17486, 17620, 17635, 18115; (Pisces) 17486; (Amphibia) 17271; (Reptilia) 17974, 17978; (Mammalia) 18069, 18070, 18072, 17080, 18081, 18084, 18085, 18088, 18093, 18094, 18098, 18101, 18103, 18104, 18105, 18106, 18107, 18109)

17275. ABEL, OTHENIO. Paläobiologie und Stammesgeschichte. [Paleobiology and history of origins.] 423p. Gustav Fischer: Jena, 1929. Pr. 22 M.

17276. BAILEY, THOMAS L. The geology of the Potrero Hills and Vacaville region, Solano County, California. *Univ. California Publ. Dept. Geol. Sci. Bull.* 19 (15): 321-333. Map, 1 pl. 1930.—The supposedly nonfossiliferous sandstone previously referred to the Markley (Oligocene) yielded *Pseudoperissolax blakei, Turritella uvasana,* and *Turricula coheni,* typical Tejon mollusks, and established its age as Eocene.

17277. BIGOT, A. Analyse de travaux récents sur le Quaternaire du littoral du Nord-Ouest de la France. *Bull. Soc. Linn. Normandie* 1: Trav. Orig. 87-93. 2 fig. 1928 (1929).—There is a note on the molluscan fauna of the region, and mention is made of *Buccinum undatum, Purpura lapillus,* and *Cardium edule.*

17278. BROWN, IDA A., and W. S. DUN. The geology of the south coast of New South Wales. Part ii. Devonian and older palaeozoic rocks. *Proc. Linnean Soc. N. S. Wales* 55(2): 145-158. 2 maps, 2 pl. 1930.—A report on a geological reconnaissance of the trail from Moruya to Bendithera. Here is found an Upper Devonian deposit crowded with casts of *Spirifer disjuncta**, west of the Deua River at Bendithera, and Silurian limestones containing several varieties of *Favosites* [Anthozoa], and crinoid stems. In late Devonian rocks on the Bateman-Braidwood road abundant casts of *Rhynchonella pleurodon* were taken. In the Quaama-Cobargo district the Devonian fossils are *S. disjuncta, R. pleurodon, Pterinea,* and *Pteronites.* In Ordovician rocks north of Cobargo were found *Diplograptus foliaceus, Climacograptus* sp., and *Dicellograptus* sp. At Bellbird Creek were taken *Rhynchonella* and casts of *Phthonia** [Pelecypoda], and a fragment of ? *Aviculopecten.*

17279. BULMAN, O. M. B. Some petrological and paleontological relations in subsurface stratigraphy. *Jour. Sedimentary Petrol.* 1(1): 37-42. 1931.—The writer discusses the importance for oil geologists of exact knowledge of species belonging to each geological stratum.

17280. CUMIN, GUSTAVO. Notizie geologiche sul gruppo del Mangart (Alpi Giulie Orientali). [Geological notes on the Mangart Massif (Eastern Julian Alps).] *Boll. Soc. Adriatica Sci. Nat. Trieste* 29: 177-204. 1 fig. 1926-27.—Records Triassic land plants, fresh water crustaceans and fishes, marine pelecypods, gastropods,

cephalopods, brachiopods, crinoids, echinoids, and corals; and Jurassic cephalopods, brachiopods, echinoid, crinoid, and coral. Bibliography.—*B. F. Howell.*

17281. **EHRENBERG, KURT. Erhaltungszustand und Vorkommen der Fossilreste und die Methoden ihrer Erforschung.** [State of preservation and occurrence of fossils and the methods of studying them.] In: E. ABDERHALDEN'S *Handb. biol. Arbeitmeth. Abt. 10, Meth. Geol., Mineral., Paläobiol. Geogr.* Heft. 7, Lief. 310. p. 751-882. 30 fig. 1929.—This treatise deals mainly with the methods of study of the life of the past which have lately been applied parallel to those of adaptation and comparative anatomy. It deals with fossilization and its phenomena, namely, conditions of fossilization, destruction and alterations of fossils, preservation of fossils, and their occurrence. Methods of study relative to conditions of preservation and to occurrence are also discussed.—*E. Antevs.*

17282. **HERITSCH, FRANZ. Silurische Versteinerungen von Allrode im Harz.** *Jahrb. Preuss. Geol. Landesanst.* 50: 510-513. 1 pl. 1929.—A small fauna from the upper Silurian from a new station. *Cardiola bohemica* shows that it is $\theta\beta$.—*F. Heritsch (transl.).*

17283. **HERITSCH, FRANZ. Die obersilurische Fauna des Wiedatales im Harz.** *Jahrb. Preuss. Geol. Landesanst.* 50: 513-580. 4 pl. 1929.—Description of a fauna belonging to the $\theta\beta$ stage from a new station. The fauna includes 56 species which for the most part are in common with the Bohemian ($\theta\beta$). There is one n. sp., (Mollusca) *Deiroceras amatum** (p. 548). The following groups are represented and sp. discussed: (Coelenterata) *Petraia, Cystiphyllum;* (Echinodermata) *Scyphocrinus;* (Brachiopoda) *Strophomena, Pentamerus, Rhynchonella, Merista, Spirigera;* (Pelecypoda) *Avicula, Goniophora, Cardiola, Conocardium, Dualina, Dalila, Vlasta, Praecardium, Lunulicardium, Paracardium;* (Gastropoda) *Phragmostoma, Pleurotomaria, Platyceras, Loxonema, Hercynella;* (Cephalopoda) *Barrandeoceras, Orthoceras, Protobactrites, Dawsonoceras,* and *Kionoceras.*—*F. Heritsch (transl.).*

17284. **LEUTHARDT, F. Über die Fauna der Bermensdorferschichten im Schweizerjura.** *Eclogae Geol. Helvetiae* 21(1): 256-259. 1928.—Lists 30 species of invertebrates (sponges, corals, worms, crinoids, echinoids, asteroids, bryozoans, brachiopods, pelecypods, gastropods, cephalopods, and crabs) from Schönrain, 40 from Hersberg, and 29 from Fluhmatt, all of Jurassic age.—*W. Berry.*

17285. **MERCIER, JEAN. Étude sur le contact du Bathonien et du Callovien en Normandie et dans la Sarthe et sur l'équivalent du Cornbrash anglais.** *Bull. Soc. Linn. Normandie* 1: Trav. Orig. 7-29. 2 fig. 1928 (1929).—The Norman beds are contrasted with the English Cornbrash especially as to ammonite fauna. *Clydoniceras discus, Macrocephalites macrocephalus,* and *Zeilleria obovata* are common to both.

17286. **MERCIER, JEAN. Application des empreintes à la celluloïdine pour l'étude des Echinodermes fossiles.** *Bull. Soc. Linn. Normandie* 1: Trav. Orig. 129-132. 1928 (1929).—The writer describes methods of using celluloïdine to make permanent prints of echinoderm structures. Celluloid is dissolved in equal parts of acetone and amyl acetate. One may add 10 to 15% castor oil to obtain transparent prints, or glycerine to obtain opaque milky prints. In making the print first a 2% solution is dropped on the specimen and when this is dry a 10% solution.

17287. **MERCIER, JEAN. Note sur des Crinoïdes parasités de la couche à Leptaena (Toarcien) de May-sur-Orne.** *Bull. Soc. Linn. Normandie* 3: Trav. Orig. 12-15. 1 fig. 1930 (1931).—The *Leptaena* beds of Toarcien period at May-sur-Orne contain a great abundance of fragments of the crinoid *Millericrinus,* many of which show evidences of parasitism*, which the author thinks may have been molluscan, perhaps *Aplacophora.*

17288. **METZ, KARL. Beiträge zur Devonfauna im Grazer Palaeozoikum. 1. Fundpunkt Thalermühle.** *Mitteil. Naturwiss. Ver. Steiermark* 67: 116-120. 7 fig. 1930.—*Spirifer sophiae**, *S. hassaki**, *Dalmania heideri, Conocardium bohemicum, Striatopora suessi,* and *Syringopora schulzei* are reported from beds that are probably transitional between Lower and Middle Devonian.

17290. **REEVES, FRANK. Geology of the Big Snowy Mountains, Montana.** *U. S. Geol. Surv. Prof. Papers* 165-D. 135-149. 1 map, 4 pl. 1931.—Pelecypods and cephalopods are recorded from the NeoJurassic Ellis Formation of this region. The Quadrant Formation of central Montana, on the basis of the listed fauna, chiefly brachiopods and mollusks, is considered Mississippian (St. Genevieve in part), except the top part of the limestone series, which is probably Pennsylvanian (Pottsville). It is older than, and should not be correlated with, the Tensleep and Embar of southwestern Montana. The limestone series at the top may be equivalent to the Amsden. Fossils—corals, brachiopods, bryozoans, and gastropods—listed from the base of the Madison limestone confirm Calvert's unpublished conclusion that there are no beds in the Big Snowy Mountains between the Mississippian (Madison) and the Cambrian (Meagher).

EXPERIMENTAL ANATOMY AND REGENERATION

17298. BECCARI, NELLO. Ovociti nella rigenerazione di innesti testicolari eteroplastici omosessuali nel Triton cristatus. [Ovocytes in regenerated heteroplastic homosexual testicular grafts in T. cristatus.] *Boll. Soc. Ital. Biol. Sperim.* 5(5): 791-794. 1 fig. 1930.—In the regenerated grafted testicular tissue ovogenesis was observed near spermatogenesis. The sexually indifferent or indeterminate condition of the Triton testis is thus corroborated.—*M. Comel.*

17299. BELLAVITIS, CESARE. Contributo allo studio delle colorazioni vitali nel sistema nervoso. *Riv. Patol. Nerv. e Ment.* 34(3): 348-363. 1929.—Injections of trypan blue were used in rabbits after injecting into the brain of the animal a foreign body (paraffin) or substances (such as virus or Na nucleinate) capable of producing a reaction. With the 2nd method the findings were negative. With paraffin not only the meningeal cells, the cells in the adventitia of the blood vessels, and the choroidal plexus took the stain, but also satellite cells of the nervous elements, and cells of the granulo-adipose type (especially abundant in the immediate zone of the wound). These last when stained with silver showed true granulo-adipose bodies in all stages of development, thus assigning to these cells a microglial origin. This gives the microglia another of the essential properties of the reticulo-endothelial system, the power to take the vital stain, which together with its migratory, phagocytic and reproductive properties should help in establishing its mesodermal origin.—*J. De Carlo.*

17300. BENASSI, ENRICO. Lo sviluppo e trofismo dello scheletro degli arti in rapporto alla allacciatura dei vasi principali. [Development and trophism of the skeleton of the limbs after ligation of the principal vessels.] *Arch. Ital. Chir.* 28(1): 49-68. 4 fig. 1931.—Two series of rabbits, 21 about 1 mo. old and 12 adults, were each divided into 3 groups (7 and 4 rabbits respectively). Group 1 of each series underwent ligature of the right external iliac artery; group 2, ligature of the homonymous vein; and group 3, of both vein and artery. The animals were killed after 24 hrs.-90 days. No skeletal difference was found between the normal and operated side, by either x-ray or dissection. The only histological difference was a temporary repletion and congestion of the juxta-epiphyseal capillary reticulum, particularly marked after ligature of the vein, less so after ligature of both artery and vein, and hardly noticeable after ligature of the artery alone; this circulatory disturbance, however, was succeeded by complete return to normal, thus confirming the compensatory activity of the collateral circulation.

17301. BERTOCCHI, ANDREA. Decorticazione periarteriosa alla Leriche ed innesti auto ed omoplastici di pelle. [Leriche's periarterial decortication, and autoplastic and homoplastic skin grafts.] *Arch. Ital. Chir.* 29(1): 1-36. 21 fig. 1931.—Experiments on rabbits (no. not stated) show that autoplastic skin grafts on vascular areas supplied by a "decorticated" artery "take" rapidly. Homoplastic grafts similarly situated are in part eliminated, but in part are retained below the regenerated epithelium, serving at least as a scaffolding for the reconstruction of the tissue replaced by the grafts.

17302. CRUZ, JOSÉ. Über die Beeinflussung der intravitalen Farbstoffablagerung in den Nieren durch Nierengifte. *Zeitschr. Ges. Exp. Med.* 74(5/6): 680-691. 1930.—Control rabbits were injected with trypan blue, which is stored in granules in the renal epithelium, and with ferrum saccharatum (which normally is not stored in the kidney) in NaCl solution. The experimental animals [no. not stated] were injected with chromic acid, Ca chromate, $HgCl_2$, or cantharidin, in addition. Trypan blue was stored in the convoluted tubules of the controls, abundantly in the primary tubules, progressively less abundantly in the tubules of the 2nd and 3rd order. The poisons (Ca chromate particularly, $HgCl_2$ less markedly, cantharidin apparently killed the animals before the effects on the kidneys were striking) deprived the renal epithelium of its ability to absorb dye and dislodged the granules it already contained. This suggests that dye distribution may serve as an index of the injurious effects of poisons on the kidney. Experiments showed also that granular deposition of dye takes place only when the cells of the uriniferous tubules are intact. Nevertheless it is not thought that dye assemblage involves an active process such as phagocytosis, but rather that deposition is a form of precipitation. Failure of dye distribution after poisoning is explained on the assumption that the protoplasm is so altered that the characteristic precipitation cannot take place.—*F. R. Hayes.*

17303. DAHL-IVERSEN, E. Recherches expérimentales sur l'autotransplantation libre de muqueuse utérine dans le péritoine des cobayes. *Lyon Chir.* 26(6): 767-781. 3 fig. 1929.—In 13 free autotransplants of uterine mucosa on the peritoneum, implantation occurred in 12 cases: on the incision in the mesentery of the extirpated uterine horn, in the angle between the cervix uteri and the bladder, at the base of the mesentery of the extirpated uterine horn, on the uterine horn at its connection with the cervix uteri, and in the scar in the uterine wall; i.e.,

the endometrium freely placed on the peritoneum became implanted only in those places where the serosa has been injured by the operation. Moreover, the entrance of blood into the peritoneal cavity could not produce a lesion such that implantation of endometrium could take place. These results do not support Sampson's theory. The superficial graft agreed with the uterine stroma in vascularity, hemorrhage and epithelial desquamation, but the deep graft showed (as previously found) no such correspondence in oestral cyclic changes. —*E. Dahl-Iversen (transl. by G. L. Kelly).*

17304. FREUND, ERNST. Histologische Untersuchungen über den Heilungsvorgang bei eingekeilten Schenkelhalsbrüchen. *Arch. Orthop. u. Unfall-Chir.* 28(3): 489-520. 12 fig. 1930.—The healing process of an impacted fracture of the neck of the femur was observed in 7 human cases up to a stage in which it was almost impossible to note the former fracture macroscopically. The periosteum of the neck takes almost no part in the callus formation. This is not due to a special quality of the periosteum of the neck of the femur but rather to its maturity, which has caused failure to form callus in other bones as well. Indeed the parosteal tissue takes a more important part in callus formation, which may even lead to a typical posttraumatic myositis ossificans. As a result of pronounced disturbances of the circulation, aseptic necrosis appeared in the fractured head in 3 cases, combated by the surrounding healthy bone marrow. This process, described in detail, is very similar to the previously described healing of aseptic necrosis in the spongiosa of the head of the femur without fracture of the neck.—*Author's summary (transl. by H. F. Nachtrieb).*

17305. GERARD, R. W., and ROY R. GRINKER. Regenerative possibilities of the central nervous system. *Arch. Neurol. and Psychiatr.* 26(3): 469-484. 1931.—In experiments on new-born rats and on fetuses in utero, the spinal cord was transected by a single clean cut with a cataract knife, and subsequently studied histologically, the "clinical" course being observed during the interim. Many experiments yielded negative or no results because the animals died or the spinal column became displaced, etc. Several rats operated on at birth, however, gave evidence of a gradual return of function. One animal, studied with special care, showed evidence of a complete section at the time of operation, was entirely paralyzed and anesthetic below the lesion for 2 wks., but in the subsequent 3 wks. recovered sensation and voluntary motion practically completely; the spinal cord showed no evidence of lesion. Several rats operated on in utero were born 5-7 days later with the sense of pain, voluntary motion, or both, present in the hind quarters; the spinal cords showed partial lesions or none. The possibility of the growth of nerve fibers into and across a lesion after complete or partial transection is definitely established. The immature spinal cord also possesses remarkable powers of physiologic reorganization which may lead to full return of function below an almost complete separation of the cord. The mass of evidence indicates that although some growth of nerve fibers from the cut end of axons may appear, return of function due to anatomic regeneration has not been proved.

17306. GIANOTTI, M., e G. BERTINI. Contributo sperimentale allo studio degli innesti testicolari. [Testicular grafts.] *Arch. Ital. Anat. e Istol. Patol.* 1(5): 797-820. 16 fig. 1930.—Experiments on 15 guinea pigs and an unspecified number of dogs (6 reported), the implants being made subcutaneously, preperitoneally and vaginally, and removed 5-45 days after operation, showed that the grafts undergo necrosis and are reabsorbed most slowly from the vaginal site.

17307. GODLEWSKI, EMIL JUN. Untersuchungen über Auslösung und Hemmung der Regeneration beim Axolotl. *Zeitschr. Wiss. Biol. Abt. D, Roux' Arch. Entwicklungsmech. Organ.* 114(1): 108-143. 36 fig. 1928.—To test experimentally the problem of the release or inhibition of regenerative activity, especially the effect of controlled inhibition, the tails of axolotls were amputated and covered. Amputated tails of yearling axolotls always failed to regenerate if the cut surface was immediately covered with living skin of the same or another animal, which healed in place. Histologically, such covering became normal skin after undergoing readjustment, involving the development of a sheet of connective tissue between the epidermis and the underlying tissues, a formation not found in normal regeneration, in which large cellular contributions are made from nests of reserve cells in the epidermis to the blastema of the future tissues. Covering the amputation surface with chamois leather did not inhibit regenerative processes. Covering the cut surface with skin after regenerative processes have started did not unconditionally stop further activity, though it may interfere with its normality and cause the formation of irregular buds and miniature tails: these tails, however small, have spinal cord, vertebral column and traces of muscles. If a new cut surface is made in a tail the regeneration of which has been inhibited, regeneration occurs on the new surface; the regeneration is quite local and cannot induce regenerative activity in any remaining part of the inhibited area; the inhibited area influences the direction and to some extent the rate of growth of the regenerant. Injection of tissue and tissue-extracts gave negative results.—*A. F. Coventry.*

17308. GORBUNOFF, W. P. Vergleichende Studien über die Knochen- und Knorpel-Auto- und Homotransplantation. *Arch. Klin. Chir.* 161(4): 651-670. 1930.—Dogs were selected in pairs and rib-bone and rib-cartilage transplants taken from each. The transplants were divided into approximately equal parts, weighed, and one part planted under the skin of the dog from which the part had been taken and the other part was transplanted to the other dog of the pair. Both dogs thus carried auto- and homotransplants. 160 such transplants were made, but some of the cases festered and some of the dogs died. The conclusions are based on 120 successful transplantations. Homocartilage and homobone are a little less resorptive than autocartilage and autobone. Often the dog's own cartilage and bone were resorbed more rapidly than was that of the other dog. An exact microscopic differentiation could not be made between auto- and homotransplants. In plastic operations, in which bone or cartilage may serve to fill a defect, cartilage must be given unqualified preference as less subject to resorption. Cartilage preserved in alcohol, because of its capacity to become converted into living, firm, fibrous connective tissue, should have manifold applications in cosmetic operations and should replace auto- and allopathic material.—*Author's conclusions (transl. by H. F. Nachtrieb).*

17309. GUERRAZZI, GUERRAZZO. L'innesto delle ghiandole da uomo a uomo; considerazioni sugli acquisiti di una polemica. [Homotransplantation of glands in man.] 23p. S. Belforte e C.: Livorno, 1927.

17310. HAAS, S. L. The union of grafts of live and of preserved fascia with muscle. A comparative study. *Arch. Surg.* 23(4): 571-580. 6 fig. 1931.—In 7 experiments on dogs, dead preserved fascia lata united with muscle just as rapidly and as firmly as did live fascia lata. The union of both dead and live fascia depended mainly on the ingrowth of the endomysium and perimysium. The muscle cells themselves appeared to be transformed into elements of fibrous tissue and to aid in the uniting process. There was some evidence that the preserved fascia lost some of its elasticity and stirred up more reaction in the surrounding tissue than did live fascia.

17311. HUMPHREY, R. R. Studies on sex reversal in Amblystoma. V. The structure of ovaries of A. tigrinum subjected for long periods to the influence of a testis resident in the same animal. *Anat. Rec.* 51(2): 135-148. 2 pl. 1931.—Previous experiments have shown that an ovary developing under the influence of a testis resident in the same animal commonly undergoes modification to a rudimentary or vestigial structure. Such ovaries often begin reversal to functional testes (i.e.,

testicular lobules begin to develop) in animals under 6 months of age. Other ovaries at this time, however, show no development of testicular lobules, and these regenerate into normal ovaries when the testis responsible for their modification is removed. In this experiment, ovaries reduced to a known rudimentary or vestigial state were left 8-14 mos. under the influence of a testis. In these ovaries the germ cells (oogonia) of the cortex decreased in numbers, sometimes eventually disappearing almost completely; regeneration of the cortex in consequence occurred slowly or not at all when the ovary was relieved of the influence of the testis. In many ovaries testicular lobules developed after a variable time, thus completing reversal into a testis. In others, however, lobules failed to develop. Such gonads usually had few or no germ cells in their hilar or medullary portions. With the reduction of their cortical germ cells these approached a condition of complete sterility. It is concluded that a small portion of all modified ovaries would remain in this state indefinitely.—*Author (courtesy Wistar Bibl. Serv.)*.

17312. **IMBERT, LÉON. Recherches histologiques sur l'évolution de la greffe osseuse.** *Ann. Anat. Path. et Anat. Normalle Méd.-Chir.* 7(3): 291-315. 16 fig. 1930.—A segment about 2 cm. long comprising the thickness of the bone was resected from the ulnar diaphysis of a dog, and then firmly replaced after being shortened. After 30 days a segment, including the graft and the ends of the bone on each side, was removed. The callus was in process of formation. Bone reconstruction involved a double mechanism: (1) Proliferation of the exogenous or periosteal bone forms a ring of areolar tissue developed nearly equally on the shaft of the bone and on the graft, which rapidly becomes abundant and, reinforced by a plug developed within the marrow cavity, forms a provisional yet strong splice. Later ferrule and plug are reabsorbed more or less completely and the marrow canal is thus re-established. This process, like that which provisionally repairs a fracture, produces an osseous neoformation with its fibrous and cartilaginous processes, but a rarefaction of the osseous tissue ensues, visible on both the graft and the living bone, and also a necrosis of the bony cells characterized by disappearance of the nuclei. All cells of the graft appear to be affected by this necrosis, but it is apparent only for a limited distance on the living bone. (2) Besides the provisional exogenous, periosteal or medullary bone, endogenous bone is produced by 2 processes: on the surface of the fracture exostoses containing living cells appear, abundant on the living bone, rare on the graft; their juncture and fusion with the peripheral bone produces definite consolidation, permitting the periosteal bone, its function performed, to disappear. The essential element in the process of graft repair is the enlargement of the Haversian canals, with consequent disappearance of the dead cells and formation of new and healthy living bone which reduces the enlarged Haversian canals to normal dimensions. This process, the result of a kind of antagonism between the destructive osseous rarefaction and the reconstructive osseous formation, goes on at all points, but not simultaneously; hence a graft examined at any moment shows both dead and living areas. In bone planted in the soft tissues and destined to be reabsorbed, the 2 processes are also apparent, but the destructive prevails, as in the failure of a graft intended to repair an osseous break. In successful cases, the osseous reconstructive process dominates and prevails over the destructive.—*Author's summary (transl. by R. T. Hatt)*.

17313. **ISHIKAWA, SHINICHI. Über die Phagozytose der Epithelien, insbesondere der menschlichen.** [In Japanese.] *Hifukwa Kiyo* 9(6): 1927.—A minute piece either of the skin, of the mucous membrane of the urinary bladder and of the spermduct of man, of the mucous membrane of the guinea pig or of the skin of *Rana nigromaculata* was cultivated in autoplasm to which India ink had been added. The epithelia, which spread like a membrane in the nutritive medium or crept along the surface of the implanted tissue, stored particles of the ink in their cell bodies. In a series of experiments also made in vivo by painting a very small amount of the ink in a small incision, phagocytic activity of the epithelial cells toward ink particles was clearly established.—*Author (courtesy Japanese Jour. Zool.) (transl. by H. F. Nachtrieb)*.

17314. **NÄRVI, E. J. Einiges zur Frage der Sehnenregeneration.** *Acta Chir. Scandinavica* 68(3): 267-277. 5 fig. 1931.—Confirming earlier conclusions, the author presents results of recent experiments on cats showing the cicatricial structure of a regenerated tendon; the regeneration is believed to arise, not from the ends of the divided tendon, but from the surrounding connective tissue.

17315. **PINETTI, PINO. Su la rigenerazione del rene. [Regeneration of the kidney.]** *Arch. Ital. Anat. e Istol. Patol.* 1(3): 353-366. 2 pl. (col.), 7 fig. 1930.—Circumscribed necrotic lesions, as nearly uniform as possible, were produced by freezing with CO_2 snow a small portion of the parenchyma in the remaining kidney in 100 unilaterally nephrectomized rabbits, which were killed in 2-200 days. The necrotic tissue was gradually replaced by new tissue. Resorption began immediately after the intervention and was complete toward the 90th day. The formation of new connective tissue and the replacement of the membrana propria of the tubules and of the capsule of the glomeruli was evident from the 3rd day. In animals killed on the 110th day and thereafter, the site of the lesion was perceptible only by a slight thickening of the capsular and intertubular connective tissue of the parenchyma immediately below the capsule of the injured portion.

17316. **SAWELSOHN, S. Untersuchungen über die Speicherung einiger Vitalfarbstoffe in den Leberzellen.** *Zeitschr. Wiss. Biol. Abt. B, Zeitschr. Zellforsch. u. Mikrosk. Anat.* 8(3): 602-616. 1929.—Absorption of trypan blue, administered by intraperitoneal injection, may occur in the liver cells of mice and rats provided the dye is administered in large doses and at frequent intervals. The amount of absorption is less than that occurring in rabbits and guinea pigs and is less in rats than in mice, while in dogs it does not occur. Hunger and protein diet did not alter the amount of absorption. —*J. P. McMurrich*.

17317. **WALLBACH, GÜNTER. Untersuchungen über die Ätiologie und die Genese der mesenchymalen Zellherde in der Leber als Beitrag zu einer Lehre der mikroskopisch sich darstellenden Zellfunktionen.** *Zeitschr. Ges. Exp. Med.* 68(5/6): 569-620. 11 fig. 1929.—Extirpation of the spleen, in rabbits and white mice (on special diet) failed to produce mesenchymal cell masses in the liver 6-90 days after this operation; rabbits subjected to anemia-producing conditions (phenylhydrazine, toluylenediamine, and actual arterial bleeding) also gave negative results; but x-ray treatment of the spleen and poisoning of rabbits with arsenic and injections of foreign protein gave positive results. The development of spleen tissue in the liver was obtained only when spleen pulp was subjected to an intense strain.—*W. Malamud*.

GROSS ANATOMY (EXCEPT PRIMATE)

17318. **BRUNELLI, G., e LINA RIZZO. Ghiandola esocrina, ovario impari ed ermafroditismo nella "Perca fluviatilis." [Exocrine gland, unilateral ovary and hermaphroditism in P. fluviatilis.]** *Atti. R. Accad. Naz. Lincei Cl. Sci. Fis. Mat. et Nat.* 7(10): 865-867. 1928.—In *P. fluviatilis* the disappearance of one of the ovaries is probably related to the presence of an exocrine gland. This gland is present, however, in both sexes and in the ♀ may furnish the mucilaginous involucrum of the eggs. In some cases an hermaphroditism seemed to exist in the ♀ while in the ♂ it was not possible to observe eggs in the corresponding gonad.—*From abstr. by E. Ponzi*.

17319. **CRABB, EDWARD DRANE. Principles of functional anatomy of the rabbit.** 137p. 33 fig. P. Blakiston's Son & Co., Inc.: Philadelphia, 1931. Pr. $1.50.—This is an elementary guide to the dissection of the

rabbit. The elementary tissues, the skeleton, and the articulations are briefly described in the first 37 pages, followed by 8 pages on nomenclature and work preliminary to dissection. In chapters V-IX are given the attachments and functions of the muscles of the left thoracic and pelvic limbs, 2 muscles of the head, 3 muscles of the neck, and 12 of the trunk with directions for their dissection. Directions for the dissection of the blood vessels, lymphatics, and the nerves of the limbs of the left side and the glands of the head and neck together with the jugular veins and carotid arteries are also included. The thorax and abdomen and their respective organs and blood vessels are given in Ch. X-XI. The dorsal and ventral aspects of the brain are shown in 2 fig. Very short descriptions of the pineal and pituitary bodies and the spinal cord are given. The 5th and 7th cranial nerves are briefly described and directions given for their dissection.—*G. S. Hopkins.*

17320. **DANIEL, J. FRANK, and L. H. BENNETT. Veins in the roof of the buccopharyngeal cavity of Squalus sucklii.** *Univ. California Publ. Zool.* 37 (3) : 35-40. 3 fig. 1931.—This remarkable group of veins was demonstrated by using new portals of injection. These vessels consist primarily of 2 large parallel trunks, designated as the buccopharyngeal veins, and certain important tributaries, draining the dorsal part of the cranium in the region of the orbit, the rostrum both dorsally and ventrally, and the larger part of the olfactory area. This group of veins is connected with the cutaneous system of veins through the dorsal cutaneous, and with the orbital sinus of the anterior cardinal system through the orbitonasal vein. These vessels finally empty their blood into the anterior cardinal sinus in the roof of the pharynx.—*J. F. Daniel.*

17321. **DU TOIT, C. A. Die Skedelmorphologie van Heleophryne regis. [With English summary.]** *So. African Jour. Sci.* 27 : 426-438. 11 fig. 1930.—Microscopic examination of a young adult and macroscopic examination of an old specimen showed that the maxilla in *H. regis* has nearly the same form and relationship to other parts of the skull as in *Rana fusca*. The prenasal cartilage is forked posteriorly and formed around the median horizontal septum of a double sac. The inferior prenasal cartilage is likewise forked posteriorly and its lowest free part supports the caudal prolongation of the pre-maxilla. The nasal cavity differs in some respect from that of *R. fusca*. A middle ear is present. The pars interna plectri is united antero-dorsally and ventrally with the sides of the fenestra ovalis; the pars media plectri is ossified; the pars externa plectri lies like a wedge against the tympanum, and carries the processus ascendens partis externae-plectri. There are 3 foramina acusticae. The vomer bears teeth. The os en ceinture is extended between the nasalia, widely separating them. A fenestra frontoparietalis and taeniatecti medialis are absent. The processus thyroideus is much elongated as in *Cacosternum* (de Villiers 1930). Its anterior portion is ossified. The hyoid articulates with the lower edge of the otic capsule. —*J. van de Erve.*

17322. **FAZZARI, IGNAZIO. Le arterie del cervelletto. Studio anatomo-comparativo ed embriologico. [The arteries of the cerebellum: comparative-anatomy and embryology.]** *Monitore Zool. Ital.* 40 (11/12) : 572-575. 1930. —The author studied the arrangement of the cerebellar arteries in different mammals and man (30 cases); he then followed their development in embryos of *Ovis aries* 9-180 mm. long. In general the vascularization of the cerebellum is affected by 4 arteries in lower mammals and by 6 as the primates are approached. In carnivores and primates, the vertebro-cerebellar artery appears as a true cerebellar artery. In other mammals, besides the 4 cerebellar arteries, others, originating directly from the basilar trunk or as collaterals of the bulbar arteries, supply a portion of the vermis. As the primates are approached these branches are seen to be homologous to the vertebro-cerebellar arteries of man. The territory of distribution of the cerebellar artery is constant in all animals, but varies in extent: the anterior cerebellar arteries supply the whole anterior lobe and the middle portion of the cerebellum and often the region of the flocculus and parafloculus; from them always originate collaterals to the corpora quadrigemina region. The posterior cerebellar arteries go to the middle and posterior lobe, frequently sending rami to the region of the parafloculus, rarely to that of the flocculus. The territory of these arteries is less constant, being dependent on the presence or absence of the vertebro-cerebellar arteries, since their development is correlated with the diminution of vascularization associated with the posterior cerebellar arteries. The vertebro-cerebellar arteries supply a territory at first small, then gradually larger, until a maximum is reached in man. One of the best supplied regions of the cerebellum is that of the flocculus, since to it go collaterals from the posterior cerebellar artery, the anterior cerebellar artery, and sometimes from the internal auditory artery; there is almost always a collateral from the anterior cerebellar artery, which often originates from the basilar trunk. Before the metencephalic anlage has formed, the blood supply for the cranial part of the rhombencephalon arises from collaterals of one artery of the mesencephalon (meso-metencephalic rhamus); the caudal and central part is supplied by arteries coming directly from the basilar trunk, including the long posterior cerebellar artery. Later, when the cerebellar anlage appears, the collaterals for the cerebellum from the meso-metencephalic branch tend to become autonomous, originating directly from the basilar trunk. There is a tendency for these anterior cerebellar arteries to fuse, forming one artery. The posterior cerebellar arteries are at first distributed to the vault of the rhomboid fossa and of the bulb; when the metencephalic anlage appears they supply it with cranial collaterals; with progressive development of the cerebellar mass these cerebellar branches become more and more important, thus acquiring the true character of cerebellar arteries; while the bulbar branches and those of the 4th ventricle develop very little.—*I. Fazzari (transl. by G. A. Bica and T. T. Job).*

Morphological differences of the prezonal region of the pectoral girdle in amphibia and their systematic significance.]** *Anat. Anz.* 65 (21/22) : 353-369. 8 fig. 1928.

17325. **GSCHWEND, THEODOR. Das Herz des Wildschweines (VI. Beitrag zur Anatomie von Sus scrofa L. und zum Domestikations Problem).** *Anat. Anz.* 72 (4/5) : 49-89. 8 fig. 1931.—In the wild hog the position of the heart is from the 2nd to 5th intercostal spaces; in the domesticated hog, from the 3rd to 6th intercostal spaces. The shape is much more pointed than in the domestic hog. The average length is 10.57 cm. compared with 7.8 cm. for the domestic species. The oblique diameter is 9.16 cm. compared with 11 cm. of the tame species. The relative weight to that of the body as a whole is 0.638% for the wild species and 0.38% for the domesticated species. The absolute weight is 336 gm., while that of the domesticated species is 265 gm. The right atrium is smaller than the left. There are 2 large pulmonary veins and in most instances a 3rd small vein. The foramen ovale is obliterated in 75% of the specimens and the fossa ovalis is 0.5-1 cm. in diam. The depth of the longitudinal sulci is more pronounced in the wild hog. The right ventricle does not have a large number of trabeculae. The moderator band in young individuals is thicker than in older ones, a condition which is reversed in the domesticated hog. The opening

into the aorta from the left ventricle is small. The formation of the anterior papillary muscle from 3 trabeculae, as in the tame species, is only faintly indicated. There is less pericardial fat, the ligamentum Botali is smaller and more delicate. The muscle fibers are thicker, denser, with more nuclei, less fat, and larger intermuscular spaces. The material studied included 15 hearts of wild hogs ranging from 35 to 93 kg. in weight, and including 3 ♀♀.—*S. P. Miller.*

17327. HUBER, ERNST. Evolution of facial musculature and cutaneous field of trigeminus. I. II. *Quart. Rev. Biol.* 5(2): 133-188; (4): 389-437. 72 fig. 1930.—In this paper, comparative anatomical, racial anatomical and embryological investigations on the facial musculature, and studies on the cutaneous field of the N. trigeminus, are correlated with data obtained from neuro-physiological research. Chapters 1-3 refer to the evolution of the motor facialis field: in the mammals the facial musculature has evolved to a remarkably high level. After having become completely separated from the deep facial musculature, the superficial facial musculature, which in the inframammalian vertebrates is restricted to the neck region, has expanded in the mammals over the whole head and face, subsequently giving rise to the many, more or less distinct individual facial muscles. *Echidna* and *Ornithorhynchus* developed their superficial facial musculature along their own line on a common monotreme ground-plan, which has, however, undergone considerable adaptive modification in the 2 monotreme types. The marsupials and placentals on the other hand share a common ground-plan of the superficial facial musculature which is fundamentally different from the monotreme plan and has diverged along many and very different lines. Hence detailed comparative anatomical studies of this field afford far-reaching evolutionary conclusions, and they are likewise of high systematic value. The great expansion of the superficial facial musculature in the mammals led to a tremendous increase in size of the motor component of the N. facialis and a rich ramification of its branches. This was accompanied by an extensive evolution of the motor part of the nucleus N. facialis in the medulla oblongata in which again the monotremes show a ground-plan which differs fundamentally from the marsupio-placental plan. In addition to this primitive motor center in the brain stem, which the inframammalian vertebrates share with the mammals, the latter acquired representation of the facial musculature in the motor cortex of the cerebral hemisphere. The motor facialis field was evidently one of the first in the phylogeny of the mammals to become definitely localized in the cerebral cortex, for it already exists in the monotremes and primitive marsupials. Within the orders of the placentals there is a gradual evolution and fuller differentiation of the motor cortex: In the insectivores, bats and rodents the motor cortex appears to have evolved little above the state found in the marsupials. The ungulates also seem not to have reached a higher differentiation. In the carnivores the various motor areas are well developed and respond with more elaborate movements. In the "ascending scale of the primates" the motor cortex, including the facial area, evolved by individualization of emerging smaller areas within the principal motor areas, attaining the greatest completeness and highest differentiation in the anthropoid apes and man. In chapter 4 it is emphasized that while in the mammals the motor facialis field is so highly evolved, the cutaneous field of the N. facialis is reduced to a mere vestige, a variable area on, and adjacent to, the outer ear. The N. trigeminus took over the cutaneous sensitivity of the face. Indeed, the cutaneous trigeminus field in the mammals has attained a high development similar to that of the motor facialis field. Also in regard to the ground-plan of the trigeminus field the monotremes show fundamental differences from the marsupials and placentals, which share a common ground-plan. All this leads to the assumption that the monotremes must have been derived entirely apart from the marsupials and placentals from a different group of the theriodont reptile stock. In the monotremes (chapter 5) the evolution of the cutaneous trigeminus field culminated in the extraordinarily rich supply of the snout, which is fur-free in its whole extent and bare of mystacial and mental vibrissae. Vibrissae are absent also in the rest of the face. The peculiar arrangement of the cutaneous trigeminal branches, on an identical plan in *Echidna* and *Ornithorhynchus*, and the absence of vestiges of facial muscles corresponding to those of the vibrissae of other mammals, are brought forward as evidence that the monotremes never possessed actively movable tactile facial vibrissae. In the marsupials and placentals (chapter 6) the evolution of the cutaneous trigeminus field is closely linked with the acquisition of facial tactile vibrissae. The elaboration of this important head-protecting and guiding mechanism led to the differentiation of individual facial muscles as vibrissae movers characteristic of the marsupio-placental ground-plan of the superficial facial musculature. The evolving tactile facial vibrissae apparatus of the common ancestors of the marsupials and placentals, requiring sensory as well as motor representation in higher cortical centers, must have played an influential rôle in the early stages of the neopallium. In the various orders and suborders of the marsupials and placentals the facial tactile vibrissae have subsequently become modified along many lines. Chapter 7 deals with the evolution of the facial musculature in the "ascending scale of the primates," illustrated with elaborate figures representing the findings in a series of selected types of the main groups of the primate stock. The gradual differentiation of the superficial muscles of the face proper (mimetic musculature S. str.) in the primates, in close correlation with the evolution of the corresponding central nervous mechanism, led to the elaboration of facial expression which in man ultimately attained marvelous perfection. It is suggested that the elaboration of facial expression during phylogeny of man closely followed the evolution of emotional life, which in turn depended on the elaboration of the association centers. An important influence is also attributed to the acquisition and gradual perfection of articulate language. This chapter moreover includes a section on the embryological development of the facial musculature in parallel series of whites and negroes, showing the critical period of development and differentiation of the facial musculature between the 2nd and 3rd month, and demonstrating in the succeeding stages the gradual structural differentiation, typical coloring and acquisition of the proportions of the individual facial muscles characteristic of the new-born, and the slight postnatal changes. While the structural differentiation of the mimetic musculature and the corresponding facial branches is completed before birth, there is practically no facial expression in the new-born. The elaboration and modification of facial expression in the course of life of the individual is briefly described, and a section is included referring to racial differences in facial expression, which are evidently the result of structural differences in the mimetic musculature (as illustrated with figures representing various human stocks), skin and subcutaneous tissue, but more so to differences in psychological reactions. In chapter 8 the superficial skin sensibility and the 3-fold deep sensibility (deep skin pressure, muscle pressure and periosteal pressure) of the face are discussed. Evidence is presented from experiments (blocking of the cutaneous trigeminal branches and subsequent electrical stimulation of the corresponding motor facial branches in the author's face) that we have muscle sense in the mimetic musculature; this sense is conducted with the muscle pressure sense, by the muscle branches of the N. facialis, though additional postural sensations may be carried back through the N. trigeminus from the skin when the latter is under tension

and wrinkled through the contracting mimetic muscles. Chapter 9 refers to reflex connections which have been established in the mammals between the sensory trigeminus field and the facial musculature. Moreover, experimental proofs are presented against the view that the facial musculature receives an additional motor supply through branches of the N. trigeminus and nerves of the cervical plexus anastomosing with the N. facialis. The experimental findings are thus in accord with the morphological findings presenting the facial musculature as a genetically uniform field innervated exclusively by branches of the N. facialis.—*E. Huber.*

17329. **KIMURA, TADASI. Morphologische Untersuchungen über das membranöse Gehörorgan der Vögel.** *Folia Anat. Japonica* 9(2): 91-142. 9 pl. 1931.—The membranous labyrinths of oriental types representative of 18 orders of birds were sectioned at 20-45 μ after celloidin infiltration. Wax plate models were prepared of each. Descriptive accounts of species are given in the following order: *Podiceps ruficollis, Nettion crecca, Larus canus, Synthliboramphus antiques, Rallus aquaticus, Columba livia, Excalfactoria chinensis, Phalacrocorax carbo, Ninox scutulata, Dryobates major, Oceanodroma leucorrhoa, Cuculus canorus, Heteroscelus incanus, Eurystomus, orientalis, Milvus lineatus, Nycticorax nycticorax, Zosterops palpebrosa, Alcedo atthis.* Comparative statements regarding each subdivision of the labyrinth are made, including calculations of gross proportions and angles of the semicircular canals. Birds as a group are comparatively uniform in the structure of the labyrinth. The most variable parts are the semicircular canals. Certain similarities exist among swimming birds contrasted to land or wading birds. Several striking similarities between non-related forms evidently are parallel developments. A full summary of structural features is given.—*A. H. Miller.*

17330. **[LANSHINA, T. N.] ЛАНШИНА, Т. Н. О некоторых корреляциях в челюстном и дыхательном аппаратах хищных и планктоноядных рыб. [Correlations in the maxillary and branchial structures of carnivorous and plankton-feeding fishes.]** [French summary.] Известия Академии Наук СССР., Отделение Физико-Математических Наук (*Bull. Acad. Sci. URSS., Cl. Sci. Phys.-Math.*) 1928(3): 253-272. 8 fig. 1928.—The manner of feeding affects primarily the force and size of the masticating musculature (M. adductor mandibulae). Its development in carnivorous spp. (*Blennius, Gadus, Scorpaena, Belone, Gobius, Lucioperca*) is correlated with changes in the skeleton; in the plankton-feeding spp. (*Mugil, Engraulis, Harengula, Caspialosa*) the orbit diminishes, the operculum diminishes and is pushed to the rear, and the musculature weakens. The size of the operculum also depends on the type of respiration. The kind of respiration affects the development of other respiratory organs: the branchiostegals, the floor of the buccal cavity with M. geniohyoideus, as well as the mechanism of the urohyal. In bottom-living forms (*Blennius, Gobius, Scorpaena*), which respire especially with the aid of the branchiostegal apparatus and the floor of the buccal cavity, this apparatus and M. geniohyoideus are well developed, but these forms have a weak operculum. On the contrary, pelagic forms (*Caspialosa, Engraulis, Harengula, Mugil*) have a well-developed operculum, but their M. geniohyoideus and their branchiostegal apparatus are weak. In the pelagic forms the urohyal is elongated, permitting the branchial cavity to be opened below. In the bottom-living forms the urohyal is short and large, and the branchial cavity is opened less fully from below. In pelagic forms (*Belone acus*), where the development of M. adductor mandibulae results in diminution of the operculum, the other organs of respiration (the floor of the buccal cavity with M. geniohyoideus and the branchiostegals) are developed. Thus the carnivorous manner of feeding can change the kind of respiration. The food habits also affect the size of the appendages of the branchial arches, though they are not the sole factor concerned. The appendages are well developed in plankton-feeders, but may be almost lacking in carnivorous forms.

17331. **LYNN, W. GARDNER. The structure and function of the facial pit of the pit vipers.** *Amer. Jour. Anat.* 49(1): 97-139. 2 pl., 14 fig. 1931.—The pit-organ of the Crotalinae consists of 2 chambers, one lying beneath the other and separated from it by a thin sheet of tissue, the "pit-membrane." The outer chamber is widely open to the exterior; the inner chamber communicates with the air by means of a small pore opening near the eye. Many nerve fibers derived from the ophthalmic and supramaxillary branches of the trigeminal nerve are distributed in the pit-membrane and are continuous with large sensory cells which are characterized by their hyaline cytoplasm. The pit-organ arises comparatively late in development, first appearing as a slight invagination between the nostril and the eye. A 2nd invagination later arises behind the first and runs beneath it to form the inner chamber of the pit-organ. The labial pits of pythons and boas are innervated by the same nerves as are the facial pits of the pit vipers, but differ markedly from the latter with respect to form and cellular structure. On the basis of the present study, a number of earlier theories as to the function of the facial pit seem to be definitely eliminated, for they demand certain peculiarities of structure which do not exist. The structure and innervation of the organ indicate that it may, as has been suggested by Noble, function in the perception of air vibrations.—*Author (courtesy Wistar Bibl. Serv.).*

Kalojanoff (transl. by S. W. Chase).*

17335. **STEGER, WALTHER. Variabilität und Missbildung im Schweineherzen.** *Anat. Anz.* 63(10/11): 145-164. 7 fig. 1927.—The material includes 24 normal hearts in 4% formalin, 19 fresh hearts opened according to Vermes' method, some studied fresh and others in Jores-solution I, and 238 hearts examined at the slaughter house. Constant features and variations are noted and particularly the great variability in the atrio-ventricular valves, in the form and strength of the papillary muscles, in the trabecular structures, in the foramen ovale, and in the cysts on the segment of the atrio-ventricular valve as reversions to a fetal form of vascularization. In one heart with combined septal defects, the relations of the atrio-ventricular valves together with the defects in the

septa exclude the explanation of an inhibited development. This is a case of a deviation from the normal process of development. Defective atrial and ventricular septa in the human heart are common but appear to be extremely rare in the pig. Literature.—*H. F. Nachtrieb.*

17336. SUMULONG, MANUEL D. Thyroid gland of the carabao. *Philippine Jour. Sci.* 44(3): 313-323. 2 pl. 2 fig. 1931.—The gland (studied in 10 animals) is bilobed as in the ox, sheep, horse, and goat, and the lateral lobes are generally brownish red in young animals but dark red in adults. The left and right lateral lobes in young animals vary in shape, but in full-grown individuals, irrespective of sex, the left lobe is generally elliptical or ellipsoidal in outline and the right irregularly triangular. Invariably, both in young and adult animals, the right lateral lobe is flatter and less voluminous than the left. The isthmus is constantly present and glandular in young subjects, but in adults may be represented only by fibrous connective-tissue strands; in old subjects it is generally absent. In adults the lateral lobes are situated along the dorsolateral aspect of the trachea, extending over the first 3 tracheal rings and the posterior half of the cricoid cartilage. Not infrequently the right lateral lobe does not extend so far forward as to lie over the cricoid cartilage. In young animals the position of this gland varies a little. The gland has practically the same relations as in the ox; the right lateral lobe, however, is not always in contact with the oesophagus. The gland receives its blood supply from the thyrolaryngeal artery and from another collateral branch of the common carotid artery which corresponds to the posterior thyroid artery in the horse. The corresponding thyroid veins are radicles of the internal jugular. The microscopic anatomy does not materially differ from that of other animals. Microscopic appearance of the gland from the young animal presents no striking difference from that of the adult.—*Author's summary.*

17337. VILLIERS, C. G. S. de. Über den Schädelbau des Breviceps fuscus. *Anat. Anz.* 72(6/9): 164-178. 8 fig. 1931.—This peculiar South African frog, popularly known as the "Jan Blom" was investigated for comparison with *Hemisus*, with which it is universally supposed to be closely allied. Minute and exhaustive comparison of the skulls of the two genera, however, proves that the two genera cannot be even nearly allied, as *Breviceps* possesses a well-developed annulus, plectrum, middle ear, Eustachian tubes and dorsal cranial fontanelle, all absent in *Hemisus*. But very interesting points of similarity with *Phrynomerus* are enumerated, e.g., the presence of posteriorly directed processes from the region of the mental symphysis, and probably of the nature of sesamoid bones. The larva of *Hemisus* is ranid.—*C. G. S. de Villiers.*

17338. WINOGRADOW, P. P. Zur normalen Anatomie des Büffels (Bos bubalus.) *Anat. Anz.* 72(12/14): 241-244. 4 fig. 1931.—The number of bones is the same as in other species of *Bos*. The skull is distinguished by the following features: the posterior portion is round and low, the horn tubercles face caudally and ventrally and are covered with thick horn, long nasal skeleton, greatest breadth in the auditory region, the external auditory meatus is longer and broader and placed almost ventrally, the bulla ossium lacrymalum is papilliform, the facies massetericae ossis zygmatici broad, tuba maxillaria is poorly developed, pars basilaris ossis occipitis is large, triangular pharyngeal tubercle massive, major palatine foramen open at juncture of palatine and maxilla, a sharp bony ridge posterior to the last molar on the maxilla. Sulcus chiamatis is shallow, sinus fronto-parietalis is poorly developed, sinus maxillaris very small, ventral border of mandible broad, processus coronoideus large, hook-shaped, with a groove at anterior end.—*S. P. Miller.*

17341. COLE, H. H., C. E. HOWELL, and G. H. HART. The changes occurring in the ovary of the mare during pregnancy. *Anat. Rec.* 49(3): 199-209. 1 pl., 4 fig. 1931.—Ovaries, fetuses, and blood samples were procured from 35 range mares throughout the period of pregnancy. The duration of pregnancy was determined by the reaction of the injected blood serum upon the ovaries of immature rats and by measurement of the fetuses. The outstanding result is the division of the gestation interval into 4 periods, depending upon the condition of the ovaries:. (1) A single corpus luteum of pregnancy and several follicles. Interval about first 40 days of pregnancy. (2) Time of formation of several corpora lutea, closely correlated with the time of high concentration of the ovary-stimulating hormone in the blood. Ovulation apparently occurs in some instances during this period. Interval, 40th-150th day of pregnancy. (3) Regression of all of the corpora lutea and absence of large follicles. Interval from about the 150th day to late stages of pregnancy. (4) Only minute vestiges of corpora lutea and rarely follicles larger than 1 cm. in diameter. Interval, late stages of pregnancy.—*Authors (courtesy Wistar Bibl. Serv.).*

17342. CUTORE, G. Modificazioni citologiche nel testicolo in seguito ad iniezioni di sostanza coloranti "intra vitam." [Cytologic modifications in the testicle after intra vitam injections of coloring substances.] *Boll. Soc. Ital. Biol. Sper.* 3(5): 588-591. 1928.—Subcutaneous injections of pyrrhol blue (1% aq. sol.) were made in 6 dogs. After 72 days the author found in the intertubular connective tissue of the testicle pyrrholophilic cells of connective tissue nature, distinguishable into spherical, spindle and flat shapes. The author concludes that intravital injections of dyes, better than any other method, differentiate in the testicle the cells of specific function, such as the seminiferous and the interstitial, from the monocytes and from particular forms of connective tissue cells, which, while differing in location, form or volume, have in common a pyrrholophilic and a granulopexic character which suggests that they belong in the not yet well defined group of resting migratory cells (Maximow) hemohistioblasts (Ferrata). —*G. Cutore (transl. by G. A. Bica and T. T. Job).*

17343. GIANNELLI, LUIGI. Sulla questione della neoformazione intravitale di uova. [Intravital neoformation of eggs.] *Monitore Zool. Ital.* 41(1): 1-7. 1930.—In adult guinea-pigs, the ovarian epithelium never presents phenomena of proliferation. Sometimes epithelial cells have been observed, detached from the epithelium and penetrating into the ovarian stroma, to assume the characters of ovogonia and ovocytes. But even such cases must be interpreted as a late differentiation of germ cells pre-existing in the ovary. Formation of new ova probably never occurs in the adult.—*E. Padoa.*

17344. INOUYE, CH. Über den Lappenbau der Niere. Eine phylogenetische Studie. *Anat. Anz.* 72(4/5): 89-105. 6 fig. 1931.—From a study of 33 kidneys ((Reptilia) *Varanus salvator, Eumeces latisculatus, Elaphe quadrivirgata, Chlemmys japonicus;* (Mammalia) *Echidna hystrix, Perameles nasuta, Phalanger cuscus, Tatusia novemcincta, Manis pentadactyla, Equus caballus, Sus scrofa, Bos taurus, Nasua rufa, N. narica, Herpestes griseus, Canis familiaris, Felis domestica, Lepus cuniculus, Mus rattus, Petaurista leucogenys, Hystrix cristata, Mogera wogura, Erinaceus* sp., *Chrysochloris sciurus, Galeopithecus volans, Pteropus pselaphon, Propithecus langer, Stenops tardigradus, Cebus vellerosus, Hapale jacchus, Cercopithecus* sp., *Macacus cyclopsis,* and *Homo*) it is concluded that the mammalian kidney is divided into lobes and lobules by means of vascular connective tissue septa. The permanent kidney consists of primary lobes and exhibits no medulla or cortex (reptiles). The secondary lobules of the mammalian kidney are formed

by the fusion of 2 primary lobes with the simultaneous formation of Henle's loops and the elongation of the collecting tubules. The so-called stellate veins of the human kidney are closely related to the superficial cortical veins of certain Carnivora. A table of measurements of the gross dimensions, as well as the number of inter-lobular septa, is appended.—*S. P. Miller.*

17348. **SHIOSAWA, ZENICHI. Über eine besondere Zellanhäufung im Gewebe der männlichen Geschlechtsorgane der Tiere.** *Virchow's Arch. Path. Anat. u. Physiol.* 273(2): 531-540. 6 fig. 1929.—The material was obtained from 13 dogs and 287 rabbits. Serial sections were made of the testes and globus major of the epididymis of 1 young and 4 adult rabbits and 4 dogs. The cell groups here described were not found in the sections of 1 rabbit, but in 2 series they were found on one side and in 2 on both sides of the testes. The cell groups were found in about 28% of the rabbits but in none of the dogs. Summary: These cell groups vary in number from 1 to 10 or more and in size from 45 to 1100μ. They are located in different parts of the sperm paths from the rete testis to the coni vasculosi. The form is not always the same. The structure is encased in a connective tissue sheath and the group is often divided into smaller clusters by a few irregularly arranged connective tissue strands with histiocytes and blood capillaries but no elastic fibers. In this respect it at times resembles a glandular tissue. The parenchyma is composed of characteristic cells that in their specific constitution differ from the normal cells of the testicular tissue,—they are relatively rich in protoplasm, generally round, often polygonal, and contain an almost round nucleus, poor in chromatin. In several preparations an inner and outer layer, with no sharp line between them, could be distinguished in the parenchyma. In the physiological condition, most of the cells do not contain any fatty substance but in experimentally produced pathological cells a small quantity of fat was produced at times. These cells are wanting in Altmann-, oxidizing- and glycogen-granules, pigment, phagocytic properties and the storing of carmine granules in vital staining. The capillary endothelium and connective tissue cells store a small amount of carmine in strong vital stains and also india ink. These cell groups appear to be more resistant to endogenous or exogenous injuries than the other components of the testis. They rarely show capillary enlargements, bleeding, or increase of connective tissue in the parenchyma. These and other specific characters the author thinks stamp the cell groups as a distinctive tissue or as an organ. The author's experiments thus far have yielded little regarding the function of this organ. That it is not a pathological structure is shown by its occurrence in healthy rabbits.—*H. F. Nachtrieb.*

ENDOCRINE GLANDS

17349. **BLOOM, WILLIAM. A new type of granular cell in the islets of Langerhans of man.** *Anat. Rec.* 49(4): 363-370. 1 col. pl. 1931.—In sections of human pancreases fixed shortly after death in Zenker-formol and stained with the Mallory-azan method, 3 types of granular cells are visible in the islets of Langerhans. Cells of the A type are filled with bright red-stained granules; the B cells contain orange-gray granules. The 3rd type of cell (D) is filled with fine, blue-stained granules, and is probably not identical with Bensley's type C, non-granular cell. The significance of this new type of cell is not known.—*Author (courtesy Wistar Bibl. Serv.).*

17350. **CHARIPPER, HARRY A. Studies on amphibian endocrines. II. The pituitary gland of Necturus maculosus.** *Anat. Rec.* 49(4): 345-357. 2 pl., 1 fig. 1931.—The hypophysis in the adult consists of pars anterior, pars intermedia, pars tuberalis, and pars nervosa: the 2nd and 3rd are purely basophilic; the 3rd is non-vascular; the 2nd contains a few isolated capillaries; the last is sacculated and its walls show little cellular differentiation. The pars anterior is highly vascular and contains basophiles, eosinophiles, and "chromophobe" cells. The eosinophiles may be subdivided, cytologically: (*a*) cells with numerous small granules grouped near the nucleus in the cytoplasm toward the capillary lumen; (*b*) cells with large spherical granules almost filling the cytoplasm on the side of the nucleus near the vascular lumen; (*c*) cells with a highly vacuolated cytoplasm; (*d*) cells with many large spherical bodies described as "secretory" spheres. Osmiophilic substance is present in the chromophobe cells and eosinophiles. This substance is similar to Golgi material and occurs as rings and large and small granules variously distributed in the different cells. The occurrence of vacuoles, variations in the osmiophilic substance, and the presence of variously sized cytoplasmic granules is interpreted as histological evidence of secretory activity in the pars anterior of the pituitary gland in the adult. This portion of the gland has been successfully tested for its metamorphosing potency by implants into anuran larvae.—*Author (courtesy Wistar Bibl. Serv.).*

17351. **DEANESLY, RUTH. The histology of adrenal enlargement under experimental conditions.** *Amer. Jour. Anat.* 47(2): 475-509. 6 pl. 1931.—The reactions of adrenals were studied in mice which received subcutaneous lethal and non-lethal toxic injections—suspensions of killed Gaertner bacilli, solutions of morphine acetate and thyroxin. The work was directed primarily toward ascertaining the histological changes involved in adrenal enlargement described as occurring under a variety of experimental conditions. Different types of adrenals were produced according to the nature and amount of the injections. The cortex might enlarge and show a decrease in its stainable fat, or an increase proportionate to the change in size; the 2 kinds of enlarged cortex could be associated both with normal and enlarged medullas. Cortical enlargement was always initiated by an increase in the size of the cortical cells, followed by their mitotic division. Mitosis also occurred in the medulla, when the latter showed enlargement, but only morphine injections, in the present work, caused an increase in medullary cell size. Medullary enlargement was associated with a loss of chromaffinity. Adrenal size was estimated by a paper-reconstruction method from serial sections. The return of the adrenal to normal after toxic injections was studied.—*Author (courtesy Wistar Bibl. Serv.).*

17352. **DOMM, L. V. Spur dichotomy in the ovariotomized brown leghorn.** *Anat. Rec.* 48(2): 257-265. 1 pl. 1931.—The normal ♀ fowl rarely exhibits spurs, though these structures are present in rudimentary form. As long as the ovary retains its normal functional activity, these rudiments remain dormant. However, following ovariotomy or pathological destruction, these rudiments become activated and develop into typical spurs. The author's ovariotomized fowl have always developed spurs. Three cases of spur dichotomy were found in ovariotomized fowl. In two the left spur was dichotomous, the right being normal, while in the third both spurs were dichotomous. In the cases showing only left-spur dichotomy, the 2 members of the pair were nearly of equal size and as large as the normal single right spur. In one case the proximal was largest, in the other the distal. In the case exhibiting both right

and left dichotomous spurs there was considerable size discrepancy, the proximal of each pair being considerably smaller. These were curved, pointed, and triangular instead of circular structures. None of the dichotomous spurs were grown together. All 3 ♀♀ were secured from the same source, two belonging to the same hatch. They were sinistrally ovariotomized when 43, 56, and 57 days old, respectively. A comparable condition has never occurred in our normal or castrated ♂♂. It is probable that a developmental arrest at an early stage is responsible for the condition.—*Author* (*courtesy Wistar Bibl. Serv.*).

17353. GRANT, MADELEINE P. The release of follicular colloid from the thyroid of Amblystoma jeffersonianum following heteroplastic anterior-pituitary implants. *Anat. Rec.* 49(4): 373-388. 3 col. pl., 3 fig. 1931.—Studies of the thyroid during different stages of activity were made with Champy fixation and hematoxylin and Mallory's connective-tissue stains. Thyroids of larvae, presenting no incipient metamorphic changes, contained numerous follicles distended with stored secretion and lined with low cuboidal cells. Occasional follicles contained a few columnar cells filled with large non-staining vacuoles. Occasional colloid droplets were seen in both the vacuolated and the non-vacuolated cells. Similar larvae received implants of frog anterior pituitary into the peritoneal cavities daily for 1, 2, 3, 4, 5, or 6 days, and were killed 24 hrs. following the last implant. The glands from individuals receiving 1, 2, and 3 implants showed no marked changes from the normal picture, except for slight but definite increases in the number of vacuolated cells. After 4 successive implants, the number of vacuolated cells had greatly increased, while the size of their vacuoles had decreased. The most striking change at this stage was the marked decrease in the amount of follicular colloid, accompanied by a simultaneous increase in the amount of intracellular colloid. Following 5 or 6 daily implants, the follicles were completely emptied and all the thyroid cells were saturated with colloid. The theory of intracellular colloid release is presented.—*Author* (*courtesy Wistar Bibl. Serv.*).

17354. HARDESTY, MARY. The structural basis for the response of the comb of the Brown Leghorn fowl to the sex hormones. *Amer. Jour. Anat.* 47(2): 277-323. 3 pl., 2 fig. 1931.—A systematic microscopic and macroscopic study of the development of the comb from the embryo to the adult ♂ and ♀ state shows the gradual differentiation of comb tissue under the influence of the gonadal hormone of a sexually maturing bird. With the structure of the mature cock's comb as a basis for comparison, studies have been made upon the histological changes which take place in regression after castration, and restoration after injection of the ♂ hormone. It is concluded that the hormone causes the secretion of large quantities of mucoid by the cells of the intermediate layer, and that the presence of this mucoid is primarily responsible for the other changes which appear. Comparison of the comb of the laying and non-laying ♀♀ suggests that the ♀ differs only quantitatively from the ♂ in its effect upon the comb. Autoplastic comb grafts have been made. Castration and injection bring the same histological results in the grafts and stumps as in normal combs. The stumps remaining after amputation do not regenerate.—*Author* (*courtesy Wistar Bibl. Serv.*).

17356. MASON, VIRGIL A. The fate of the ultimobranchial body in the cat (Felis domestica), with special reference to cyst formation within the thyroid. *Amer. Jour. Anat.* 49(1): 43-64. 2 pl. 1931.—The ultimobranchial body in the cat is a regressive structure and shows no evidence of possessing a function. It arises in close association with thymus IV, and the two unite as one epithelial mass. They become reticulated (about the time of contact with the thyroid), forming a syncytium, which is soon obscured by thymocytes. When this occurs, the resulting structure, made up of the ultimobranchial body and thymus IV, is called the internal thymic lobule. Thymus IV is variable in its development and sometimes lacking. Complex IV (ultimobranchial body, thymus IV, parathyroid IV), due to its growth shiftings and the expansion of the thyroid, is usually partially or entirely embedded in the thyroid, but may be entirely external. There was no evidence in the cat that the ultimobranchial body contributed to the formation of the thyroid or that the thyroid transformed into internal thymic lobule. Cysts are normally present in the thyroid of the cat and may be small and isolated or large and in direct communication with the medullary portion of the internal thymic lobule. They are derived from cell cords of the ultimobranchial body which undergo degeneration. As that part of the ultimobranchial body and thymus IV which is not cystic is thymic, cyst formation and thymic transformation are in reciprocal relation.—*Author* (*courtesy Wistar Bibl. Serv.*).

17358. WILLIAMSON, G. SCOTT, and INNES H. PEARSE. The anatomy (comparative and embryological) of the special thyroid lymph system, showing its relation to the thymus; with some physiological and clinical considerations that follow therefrom. *Brit. Jour. Surgery* 17(67): 529-550. 20 fig. 1930.—A special thyro-thymic lymph system is described as the essential and most primitive feature of thyroid anatomy. Structurally all thymic tissue is formed of the coiled, plicated capillary terminals of the thyro-thymic lymphatics, and the thymus is thus essentially of the nature of a lymph reservoir to the thyroid. A special lymphogenic secretion of the thyroid is poured into the thyroid lymph sinusoids and can, under proper conditions, be seen pervading the thyro-thymic lymph system. Embryological and phylogenetic studies of the thyroid confirm the above anatomical facts, for in the most primitive thyroid, the naked epithelial sacs lie in a cavernous lymph-sac, which in the course of phylogenetic development becomes the thymus of man. In considerations of the thyroid function, the thyroid and thymus must be regarded as one apparatus. Clinical aspects in relation to Grave's disease, thyrotoxicosis, endemic goitre, thyroid cancer, and cystic hygromas are considered.—*P. L. Risley.*

UNCLASSIFIED

17359. BRACK, E. Über die "Glashäute" der Epithelien. *Zeitschr. Wiss. Biol. Abt. B, Zeitschr. Zellforsch. u. Mikrosk. Anat.* 9(3): 534-543. 9 fig. 1929.—The authors have investigated the relation between 2 subepithelial membranes, the "glashäute" (basal membrane) and the reticular layer. From studies on normal and pathological tissues of skin, mammary glands, reproductive organs, respiratory tract, and alimentary canal, they concluded that the "glashäute" develops from the reticular layer. By using van Gieson's stain, red and yellow basal membranes are clearly differentiated, representing sclerosis and hyalinosis respectively. Pressure and pulling actions play important rôles in the genesis and dissolution of the membrane, so that it is a question of acquired and not inborn formation of the basal membrane. A fine, fibrous network is the only

inborn structure, which under certain conditions (senility, inflammation, tumors) becomes sclerotic, thick, hyaline, and finally forms the basal membrane.—*R. C. McCardle (transl. from abstr. by P. Caffier).*

17360. **CH'UAN, CHANG HUI. Mitochondria in osteoclasts.** *Anat. Rec.* 49(4) : 397-399. 1 pl. 1931.—From the jaws of a very young hamster, the author secured bone sections without decalcification and thus stained mitochondria. As the mesenchymal cells, reticular cells, or osteoblasts become osteoclasts, their mitochondria increase in number. In areas of active bone development the osteoclasts contain more mitochondria than any other cells. These facts are taken to indicate that osteoclasts are not degenerating cells.—*Author (courtesy Wistar Bibl. Serv.).*

17361. **DAVENPORT, C. B. Adolescent spurt in growth. The laws of life, memorial volume in honour of the 60th birthday of Prof. Dr. V. Růžička, Prague, Czechoslovakia.** 10p. Aventinum: [Prague], 1930.—The mass curve of increments owes its form to the summation of many highly variable individual curves of increment, and has little significance for the individual. The maximum velocity of growth ordinarily occurs in boys between 13 and 15 and is correlated with a growth of the external genitalia at this age. That the gonads play a part in this adolescent spurt is strengthened by the fact that in gonadectomized mice the adolescent spurt is less marked than in unoperated mice.—*C. B. Davenport.*

17362. **EVANS, JOHN N. Retinal perivascular delineation.** *Arch. Ophthalmol.* 6(6) : 823-839. 6 fig. 1931.—The writer reviewed all earlier work and then modified the methods. Over 200 animal eyes were used (dogs, cats and rabbits) and, finally, a modification of the Weed-Wegefarth method was used—that of injecting an isotonic solution into the vitreous and later precipitating Prussian blue. The preparations, as finally obtained by this technic, would seem to indicate that under the conditions of these experiments a certain portion of the fluid elements of the vitreous passes out of the eye through the retinal perivascular perineural system. Also that this system is connected with the retinal pericellular and perifibrillar spaces. That the fluid is actually in some sort of a formed space is not evident from these studies, as the histological structure of such a space is not made evident by the means here employed. Moreover, it would not seem justifiable to accept the findings of these studies as evidence of a similar state under strictly normal conditions. After all, some disturbance of the normal pressure and biological balance must have occurred. At most it is only fair to assume that the Prussian blue particles indicate the site to which the injected fluid had passed in the eyes employed and under the conditions of the investigation.—*J. N. Evans.*

17363. **[ELISEEV, V. G.] ЕЛИСЕЕВ, В. Г. Культуры in vitro мигательной перепонки кролика. [Cultures in vitro of the nictitating membrane of the rabbit.]** Известия Томского Государственного Университета (*Trans. Tomsk State Univ.*) 82: 167-173. 1 pl. 1928.—Excised fragments of the membrane were rinsed in Ringer's solution, placed in Petri dishes, irradiated for 5 min. with mercury-quartz lamp at 45 cm., and minute pieces planted in homogeneous plasma. Some cultures were not irradiated, and some, retained as controls, not rinsed, in addition. A total of 150 cultures were made. Non-irradiated fragments showed more intensive growth in vitro than those irradiated. In the latter, epithelium tended to become imbedded in the connective tissue, showing atypical growth. Excretory ducts and secretory parts of the glands were dedifferentiated. Their cells hypertrophied, giving rise to characteristic, compact, epithelial islets within the explant. The elements of these islets multiplied rapidly by mitosis.

17364. **JANATKA, JIŘÍ. Vznik, skladba a význam nucleus pulposus ploténky meziobratlové.** *Rozpravy České Akad. Věd. a Umění, Tř. 2.* 39(číslo 29) : 1-8. 1 pl., 3 fig. 1929(1930). Also as: **Genèse, structure et signification de nucleus pulposus d'un disque intervertébral.** *Acad. Tchèque Sci. Bull. Internat. Rés. Trav. Prés. Cl. Sci. Math., Nat. et Méd.* 30: 289-291. 1 pl., 3 fig. 1929.—The nucleus pulposus of the intervertebral discs in man is composed of gelatinous substance, granules, fibers and cells. The granulations, albuminous-like, arise from the fundamental cartilaginous substratum. The fibers are arranged in 3 zones, a medial and 2 marginal zones separated by liquid substance. The medial zone is larger, the fibers parallel to the disc surface, while the marginal ones lie vertical to those of the medial zone. The basophilic cells contain albuminous granules and show hydropic degeneration. The nucleus pulposus is surrounded by an annular fibrosa layer composed of collagenous fibers containing chondromucoid substance. The nucleus pulposus develops by transformation of the cartilaginous substratum. The function of the nucleus is shown by its structure; it acts as a cushion to withstand pressure and tension. There is considerable pressure present even at rest.—*E. A. Baumgartner.*

17365. **KING, HELEN DEAN, and HENRY H. DONALDSON. Life processes and size of the body and organs of the gray Norway rat during ten generations in captivity. Pt. I. Life processes; Pt. II. Size of the body and organs.** *Amer. Anat. Mem.* 14. 106p. 1929.—Some effects of captivity on the wild gray Norway rat are here reported. This study is based on gray Norway rats reared by King for 10 generations. There were 1539 litters containing 9505 individuals: 4680 ♂♂ and 4825 ♀♀. The effects of captivity on the life processes are considered by King and involve records of rate of body growth, variability in body weight, the reproductive period, number of litters cast, number of individuals per litter, sterility, sex ratio, mortality, and changes in behavior. The weights of organs and bones are considered by Donaldson and involve records for body weight, body length, weight of brain and some parts, weights of hypophysis, thyroid, suprarenals and gonads, and weight, length and percentage of water in femur—representing the bones. The data for the captive gray Norways are compared with the corresponding data for the common albino, captive for many generations.—*Authors (courtesy Wistar Bibl. Serv.).*

17366. **NAGEOTTE, J., and L. GUYON. Reticulin.** *Amer. Jour. Path.* 6(6) : 631-653. 3 pl. 1930.—The authors' observations support the "unitary hypothesis," i.e., that reticulin is essentially the same as collagen. According to them, there exist different varieties of reticulin, all in continuity of substance with the collagen bundles so that the connective tissue framework forms a single system. The elastic fibers, on the contrary, though mingled with the connective tissue framework, have no continuity with it. Subcutaneous areolar tissue is well adapted to complete histological analysis. In the edematous tumor it can be demonstrated that, contrary to general opinion, the collagen bundles form a network like the reticulin. From the network of reticulin, which in this tissue is particularly delicate, to the network of collagen bundles, the transition is gradual and continuous, both in the thickness of the fibers as well as in their coloring by Ag. When, in a tissue having a connective tissue framework, there are fixed cells other than fibroblasts, it is these cells that govern the arrangement of the reticulin. The fibroblasts, on the contrary, are scattered at random; they lodge where they can and they do not cause any special arrangement to be constructed around themselves. In the adult, the fibroblasts are distributed in the connective tissue framework throughout almost its entire extent, but they are absent in some territories, such as the fat lobules and the hepatic lobules, where the framework is exclusively reticulated. Treatment of the tissues with normal solution of NaOH (4%) does not hinder the impregnation of the reticulin by Ag. Boiling the tissues, causing progressive fragmentation of the reticulin, does not prevent the coloring of the fragments with Ag as long as they persist. The reticulin of the splenic pulp does not resist boiling as long as that of the liver. In Ag

impregnations, the color assumed by the fibers depends on physical conditions, on their thickness and conformation, but not on their chemical composition. This feature, then, cannot serve as a criterion to establish a systematic distinction between collagen and reticulin. The interfaces play an important rôle. Viewed with the ultramicroscope the collagen bundles present a broad, mirror-like surface, while the reticular fibers appear as sparkling lines. Like reticulin, fibrin stains black with Ag, if the clot has been washed before fixation, but it does not stain if the albumins of the serum remain in contact with the fibrils. Treated with a dilute acid, the tendons of the rat's tail, but not those of the paws, yield a substance (Collagen A) which coagulates in fibrils under the influence of neutral salts. These fibrils have all the properties of natural collagen except that they are more easily soluble in acids; they stain black with Ag exactly like reticulin. The tendons of the rat and those of the rabbit and the dog, treated with NaOH and then with a dilute acid, yield another substance (Collagen B) which also coagulates in fibrils with neutral salts. These fibers also stain black with Ag. Tendons of bovines yield neither Collagen A nor Collagen B. To say nothing of differences in the zoölogical series, homologous substances in the same animal present regional variations that selective stains do not reveal. Variations of this kind exist between the reticulins of various organs, but these differences are not of a nature to establish a distinction between a collagenous system and a reticulin system; for nothing has been observed so far that warrants the supposition that the collagen part and the reticulin part of a given tissue differ in any way in the chemical constitution of their substance.—*Authors' summary.*

17367. **NEŠPOR, JOSEF. Differenciace a dedifferenciace tkáňových kultur s hlediska měření vitality.** *Rozpravy České Akad. Věd. a Umění, Tř. 2.* 39(číslo 24): 1-6. 1929(1930); also as: **Différenciation et dédifférenciation des cultures de tissu au point de vue de la mesure de la vitalité.** *Acad. Tchèque Sci. Bull. Internat. Rés. Trav. Prés. Cl. Sci. Math., Nat. et Méd.* 30: 82-83. 1929.—Attempting by histochemical and physiological means to obtain decisive evidence on the moot question as to whether tissues in culture can undergo dedifferentiation, the author grew cultures of frog skin in the Lewis-Lewis medium, at high temp. ("E" cultures); controls were kept at room temp. ("K" cultures). At 3-day intervals, portions from these cultures were subjected to a nuclear reaction (Feulgen-Rossbeck, Schiff technique), to the ninhydrin reaction (mod. by Berg, 1922), and to measurement of internal pH by the Vlès and the Wagner-Needham methods. The Feulgen test showed no nuclear pycnosis in the "E" cultures; the ninhydrin test demonstrated products of protein destruction in the center of the culture, more intense in the "E" series; the reaction of the explanted tissue, acid in the beginning, approached alkalinity in the "E" cultures; it changed from around pH 6.2 to around pH 6.0 in the first 3-day interval, but steadily became more alkaline, rising to around pH 7 in the succeeding 2 intervals. The above changes are interpreted as supporting the view that dedifferentiation or rejuvenation takes place; from the relation which exists between pH, viscosity, and colloidal stability, it may be assumed that, likewise, the tissue outside the organism follows the principle of protoplasmic hysteresis.

17368. **NOHIRA, A. A study of the movement of corneal epithelium explanted in culture medium.** *Acta. Dermatol.* 12(1): Japanese orig. 29-69; English summary 69-72. 14 fig. 1928.—Epithelium of *Rana nigromaculata* and *R. rugosa* was cultivated in autogenous and homogeneous plasma. Vital staining with neutral red and nile blue was applied to determine the origin of the epithelial cells in the cultures. As Matsumoto found, the cells belonging to different layers of the epithelium show a different arrangement of the stained protoplasmic granules. The upper layer of cells shows no granules and is not active in the explants. The middle and basal layers always move together and both are active. During the movement, the individual cells spread and the thickness of the different layers is reduced, resulting in an increase in the area occupied by the epithelium. There are no cell divisions. In older explants the epithelial membrane sometimes consists of only 2 layers of cells, or even one layer formed by the epithelial cells of the basal and middle layer of the normal cornea. The gradual stretching of the cells during their movement causes a decrease in the stratification of the epithelium. The epithelium moves over the underlying connective tissue until this is entirely surrounded. Sometimes the epithelium moves in the culture medium instead of covering the underlying tissue. Wandering cells seem to arise chiefly from the upper cells of the middle layers, (contra Erdmann). The epithelial cells moving around the connective tissue live longer than those moving in the culture medium. The sheet-like expansion of the epithelium takes place many times without showing any evidence of pseudopodia; in these cases the expansion cannot be regarded as a mere sum of the individual cell-movements. "The sheet-like movement, however, can not be explained, as Oppel suggested, as a quite different and independent type of cellular movement, corresponding, for instance, to a muscle fiber contraction; but is to be considered as the movement of the epithelial cells en masse, ruled more or less by a certain governing power by which each epithelial cell is unable to display its autonomy." The cells are under cytotropistic control. Stereotropism plays an important rôle in determining the direction of the epithelial movement.—*J. P. M. Vogelaar.*

17369. **PAFF, GEORGE HUGO. A quantitative study of the capillary supply in certain mammalian skeletal muscles.** *Anat. Rec.* 46(4): 401-405. 1930.—Capillary counts were made from camera-lucida drawings of injected homologous skeletal muscles of the rat, guinea-pig, and cat. The rat has the largest number of capillaries per sq. mm. of muscle and the cat has the least. The values ranged from 3573 to 2341 capillaries per sq. mm. From the same drawings the "fibers" were cut out. By comparing their total weight with the weight of a known area of the same paper, the ratio of muscle tissue to connective tissue in muscle fasciculi was computed. In transverse paraffin sections this ratio is 7:3. The average cross-section area of muscle tissue (excluding connective tissue) metabolically dependent on a single capillary was computed. An inverse proportion exists between the intensity of metabolism and the area of muscle tissue supplied by one capillary. By direct measurements on camera-lucida drawings (cross-section paper) the average area of muscle fibers in cross-section was computed for each muscle. In general, muscle fibers in the guinea-pig are considerably larger than those in the rat and cat. In the rat and cat they are approximately equal.—*Author (courtesy Wistar Bibl. Serv.).*

17370. **PRICE, JOHN W. Growth and gill development in the small-mouthed black bass, Micropterus dolomieu, Lacépède.** Ohio State Univ. Press, Franz Theodore Stone Lab. Contr. 4. 46p. 1931.—The present study represents an attempt to determine the relations that exist between the gill surfaces and the body measurements and weight, and to correlate the growth of the gills with the growth of the body throughout the life history of the fish. The data for this paper have been obtained from a study of 127 specimens, ranging in total length from 1 to 27 cm. The data have been treated statistically and the results shown graphically. The components of the gills grow at a differential rate. The filaments, when the fish hatches, are small and relatively few in number, especially on the most posterior gill arch. During the first half of the life history, their number increases very rapidly, reaches a maximum and thereafter is constant. The linear dimensions of the filaments, such as length, width and depth, grow at a constant rate throughout the life history and in direct proportion to the total length of the fish. The area of the folded surfaces of the filaments, as well as of the smooth surfaces, varies as

the square of the length of the fish. The area of the folded surfaces, however, is expressed by the interrelation of the height of these folds, their number per running millimeter and the length of the filament. As the fish grows, these lamellae increase proportionally in height but decrease in their numbers per unit length of the filament. Thus, increase in total gill surfaces is acquired at first by increases in the numbers of filaments, and the relatively large numbers of lamellae per linear dimension of the filament. Later, the factors of the size of filaments and height of the lamellae assume greater relative importance in gill growth. The gill surfaces maintain a constant relationship to the total length of the fish at all sizes, the gill surface increasing at a rate in excess of, but approaching the square of the total length of the fish. The body measurements of width and depth in the Small-mouthed Black Bass increase in direct proportion to the length of the fish, the form of the body being constant throughout life. The weight of the body increases as the cube of the length, and their variations are highly correlated. The relation between the total gill surface of the bass and its weight is expressed by an equation, where the square root of the gill surface is equal to the cube root of the weight multiplied by a constant. However, the gill surface per 1 gm. of live weight is proportionally greater in younger than in older fish. This is correlated with the fact that the metabolic rate is higher in younger fishes.—*J. W. Price.*

17371. **RINEHART, JAMES F. Reticulum. Its origin. The occurrence of reticulum fibrils in capillary endothelium. A new method of demonstration. II. The finer capillary bed.** *Amer. Jour. Path.* 6(5): 525-539. 6 pl. 1930.—This new method of metallic impregnation yields complete impregnation of mesenchymal, reticulum and collagen fibrils, and permits adequate polychrome counterstaining of the impregnated tissues. The mesenchymal cells possess a rich, delicate fibrillar cytoplasm. Morphological support is given for the concept that capillaries are formed in situ by a direct differentiation of the mesenchyme. The capillary endothelial cell remains in the embryo as a fiber-producing cell and this capacity persists into the mature organism. Both reticulin and collagen are fiber products derived from a common fibrillar matrix and are undoubtedly chemically similar. Reticulum fibers are demonstrated in capillaries in tissues of a sufficiently wide variety to justify the concept of their universal occurrence in the capillary endothelium. Otherwise stated, reticulum may be identified as the fiber product of capillary endothelium. In the lymph nodes similar fiber substance is present in the endothelial and reticulum cells which, like the capillary endothelial cells, are little differentiated, direct descendants of the mesenchyme. Reticulum fibers are also present in the intersinusoidal or so-called reticulum cells of the splenic pulp and line the sinusoids of the liver. Reticulum fibers are little changed descendants of the mesenchymal fibers. Evidence is presented for the transformation of reticulin into collagen. Reticulum is the most widespread and important supporting substance in the body. It is the scaffolding of cells and cell units. Reticulum fibers form the immediate lining of capillaries and minute reticulum-lined spaces are shown extending between and connecting the capillaries as seen in ordinary sections. Such channels are considered to serve normally for the transfer of elements contained in the blood plasma and to be capable of enlarging or "opening up" under effective stimulus to a caliber sufficient to convey corpuscular elements. This endothelial reticulum is identified with the basement membrane in the kidney, pancreas, adrenal and gastric mucosa; this probably applies to basement membranes in general.—*From author's summary and conclusions.*

17372. **SAAL, RUDOLF von. Beobachtungen über den feineren Bau des menschlichen Zahnbeines. (Zahnstudie IV.)** *Zeitschr. Wiss. Biol. Abt. B, Zeitschr. Zellforsch. u. Mikrosk. Anat.* 11(3/4): 638-657. 22 fig. 1930.—The readily stained fibers of Tomes in the canaliculi of the dentine are complex structures of protoplasm and a framework. The darkly stained ring around the Tomes fibers is the sheath of Neumann. The clear layer between this and the fiber of Tomes is largely an artificially produced enlarged space traversed by fine radial fibers. In the sheath of Neumann there are longitudinal fibers, a cross section of which shows about 18 granules at regular intervals; a spiral thread is also present. Surrounding the sheath of Neumann is an additional sheath that is becoming calcified, or already lies in the ground-substance. The sheath of Neumann is connected with the fiber of Tomes through fine threads that extend to the granules mentioned and now and then come in contact with, or are united with, the longitudinal fibers. Furthermore these fibers pass further peripherally to the older sheath of Neumann and beyond this to the ground-substance of the dentine. On the basis of these observations, the author modified the scheme of Kantorowicz. —*Author's summary (transl. by H. F. Nachtrieb).*

17373. **SHIBATA, SHIN. Histologische Untersuchung der Gitterfasern in den Zahnpulpageweben und ihre Bedeutung bei der Dentinbildung. (Japanisch.)** *Jikken Igaku Zasshi* 11(6): 1927.—The author stained the normal dental pulps of man and mammals with the Bielschowsky stain for lattice-fibers. In such preparations the lattice-fibers stain dark brown or deep violet. They arise from pulpal cells and from the fine reticulate fibers in the walls of vessels in the middle and deep layers of the pulp, and run, winding spirally, through the odontoblastic layer into the dentinal matrix. Most of the fibers are simple, but some unite with one another and others anastomose with neighboring fibers by lateral branches. A few disappear near the dentine. The fine lattice-fibers in the dentinal matrix lie parallel to the dentinal tubules. If calcification is advanced, the fibers are stained with difficulty, but can be observed well in the interglobular spaces. These fibers stain just as do the lattice-fibers of other tissues and appear to be quite distinct from the fibrils of Ebner in the dentinal matrix. The lattice-fibers are demonstrable in all stages, from the dental papilla at the beginning of development of the pulp on to senile atrophy of the pulp, and also in shrinkage of high degree. During dentinogenesis the lattice-fibers are in part differentiated into collagenous fibers and become the foundation layer for calcification of the dentinal matrix. After dentinogenesis they remain unaltered in the matrix and serve to connect the dentine with the dental pulp.—*O. Mori (courtesy Japanese Jour. Zool.) (transl. by S. W. Chase).*

17374. **SONDERMANN, R. Beitrag zur Entwicklung und Morphologie des Schlemmschen Kanals.** *Graefe's Arch. Ophthalmol.* 124(3): 521-543. 19 fig. 1930.—From preparations of eyes of embryos of 3, 4, and 8 mos., of children still-born, 2½ mos. and 3½ yrs. old, and adults aged 52, 64, 70, 71, and 84 yrs., the author concludes: Schlemm's canal was laid down first not as a circular vessel but as radial channels which conduct the blood from the tissue in the rim of the optic cup to the anterior ciliary veins during the 2nd mo. and the first ½ of the 3rd. They run for a distance in the edge of the sclera. At the point of their entrance into scleral tissue a localized enlargement occurs as a result of a compression by the contracting sclera. The remainder of the vessel becomes obliterated. The enlargements become connected by the dilation of capillaries. In this manner a circular canal is formed. Thus in the same eye, a large lumen and numerous plexus-like small channels may replace Schlemm's canal. The defects of the pectinate ligament communicate freely with the Schlemm's canal through an internal canaliculus usually opening near the lateral end of the canal. The external canaliculi opening into the anterior scleral vein are almost always given off from the medial portion of the canal.—*Author's summary (transl. by T. J. Putnam).*

17376. **WOLF, JAN. Umělé vytvoření kollagenních fibrill in vitro a bez přítomnosti buněk procesem gelatinisace fibrillárních solů. [Production of collagen fibers in vitro and in the absence of cells, by gelatinization of fibrillar sols.]** [With French summary.] 47p. 14 pl., 1 fig. Nákladem České Akad. Věd. a Umění: Prague, 1931.—Cases are presented where collagen fibers are formed inside large cell-free cavities, independently of the action of cells, by the gelatinization of fibrillar collagen sols. These cases are: (1) formation of clumps of collagen fibers in needles inside of cavities of the "amianthic" spaces and of cavities of colliquation, cell-free, in the costal cartilage of man; (2) similar formation of clumps of fibrils in the arytenoid cartilage of cattle. The nature of the fibrils in these needles is demonstrated: by selective stains which show the collagen; by anisotropy; by the penetration of these fibrils among those of functioning tissues; and by their unmistakable homology with the other collagen fibrils in surrounding tissue. The case in which elastic needles were found in cavities of colliquation of the arytenoid cartilage of cattle makes it probable that the elastic fibers have a similar origin, i.e., that they are formed by gelatinization of elastic sols. The elastic nature is proved: (1) by elective staining to demonstrate elastin; (2) by digestion by trypsin; (3) by the transitory formation of these needles in elastic precipitate on the one hand, and in elastic fibers in the other. If, as seems to be the case, the collagen fibers originate by simple gelatinization of fibrillar collagen sols, it may be possible to imitate and repeat these experiments of living tissue, and to obtain the same collagen fibers artificially in analogous circumstances (i.e., in vitro) by the same process (gelatinization of fibrillar collagen). The author succeeded in obtaining true collagen fibers in the absence of cells, by this process, from the fluid taken from the cavities of colliquation of the arytenoid cartilage of beef. They are shaped, variable in size, sometimes curved, sometimes straight, sometimes wavy, generally aggregated in rosettes. These can be shown identical with the fibrils occurring in the cavity in vivo.

17377. **RISCHARD, MICHEL. Sur la vraie valeur des muscles de l'iris.** *Bull. Histol. Appl. Physiol. et Path.* 8(1): 21-26. 1931.—These muscles are extensions of the ciliary body, which is a ring fixed to the sclera. Contraction therefore causes pupil dilatation. With the oculomotor nerve cut the sympathetic controls all pupil movements while with the sympathetic cut the pupil fails to respond to oculomotor stimulation. Direct stimulation of the sphincter dilates the pupil. There is no proof of radial fibers to the iris.—*J. G. Sinclair.*

17378. **WOOD, HORACE ELMER II, and FLORENCE DOWDEN WOOD. Refutation of the alleged diametric growth of erupted rat molars.** *Anat. Rec.* 48(1): 169-183. 1931.—Measurements and impressions of the molars of 7 Wistar-stock albino rats, made at intervals throughout life, show no trace of the diametric growth deduced by Donaldson and French from averages for individuals killed at different ages. The experimental evidence agrees with the fact that no mechanism is known capable of producing posteruptive growth in rooted teeth.—*Authors (courtesy Wistar Bibl. Serv.).*

DESCRIPTIVE

17379. **BECCARI, NELLO. Il differenziamento dei centri tegmentali nell'asse cerebrale degli embrioni di Selacei. [Differentiation of tegmental centers in the cerebral axis of embryo selachians.]** *Monitor Zool. Ital.* 40(11/12): 325-328. 1 fig. 1930.—The author treated embryos of *Scyllium* and *Pristiurus* with Cajal's $AgNO_3$ method. He recognized in the cerebral axis of these selachians the existence of a metencephalic, a myelencephalic, and a meso-diencephalic tegmental center. There were no cells exclusively mesencephalic. In the metencephalic center, the author distinguished a pretrigeminal nucleus and a principal nucleus. The pretrigeminal nucleus, principal metencephalic nucleus and the myelencephalic center correspond to the 3 reticular nuclei described by Van Hoewell in Raja.—*N. Beccari (transl. by W. A. Willard).*

17380. **BEGG, R. CAMPBELL. The urachus: its anatomy, histology and development.** *Jour. Anat.* 64(2): 170-183. 2 pl., 4 fig. 1930.—In the adult the urachus is a cone-shaped structure averaging about 5 c.m. in length from the apex of the bladder to its attachment to the remnants of the umbilical arteries. The urachus arises developmentally as the cephalic end of the urinary bladder, which is in turn derived from the ventral cloaca and the proximal ends of the mesonephric ducts. During postnatal life it shares in the caudad descent of the bladder, but retains its attachment by fibrous strands with the remnants of the umbilical arteries. Although it takes part in the descent of the bladder it does not grow as rapidly as this organ. Histologically the posterior face of the urachus is invested by the peritoneum and its anterior face is embedded in the fascia of the transversalis muscle. Beneath these outer layers is a layer of areolar tissue enclosing a thin, denser layer of fibrous connective tissue. The next internal layer is formed of muscle fibers continuous with the muscular coat of the bladder. These fibers spread in strap-like fashion in the bladder wall to end at the prostate. Thus the urachus acts as a sort of center of action for contraction of the muscular coat of the bladder. Internal to the muscular layer there is a dense fibrous layer which supports a delicate tunica propria investing the transitional epithelium. The urachal canal is a tortuous channel about 1 mm. in diameter which may be discontinuous by reason of the masses of degenerating desquamated epithelial cells. In about 2 out of 3 individuals the lumen is separated from the lumen of the bladder by a thin valve-like partition of the mucous membrane.—*J. E. Kindred.*

This investigation includes a re-examination of the literature concerning the numerous ligaments and peritoneal folds of the pelvic region, as well as descriptions of the development of the structures in question. Various stages of both ♂ and ♀ embryos are used in an elucidation of the terminology of the various ligaments, including the broad ligament, the appendiculo-ovarian ligament of Clado, the mesovarium and mesorchium, etc., and their interrelations. The displacements of the folds during the migration of the ovaries and testes are considered in detail, and some attention is given to the shiftings of the other organs of this region. A critical consideration of the various views of other authors forms the greater portion of this paper.—*P. L. Risley.*

17384. **LÖWENKRON, HANS. Über die Entwicklung des Bindegewebes der grossen Mundspeicheldrüsen bei menschlichen Embryonen.** *Zeitschr. Ges. Anat. Abt. 1, Zeitschr. Anat. u. Entwicklungsgesch.* 93 (3/4) : 370-385. 10 fig. 1930.—Epithelial anlagen of salivary glands exercise a formative influence upon embryonic connective tissue leading to the development of a connective tissue mantle. Main stages in the process are: cells divide and round up; nuclei become large, spherical, deeply staining; fibrils form into bundles parallel to the surface of gland and separate the lobes from each other; blood vessels invade the connective tissue when the end buds of the glands appear.—*A. E. Adams (from author's summary).*

17385. **MAINLAND, DONALD. The early development of the ferret: the pronuclei.** *Jour. Anat.* 64 (3) : 262-287. 7 fig. 1930.—The pronuclei in serial paraffin sections of 71 tubal ferret ova were examined in detail. The results were subjected to biometrical tests (chiefly χ square), in place of the usual method of untested observation. In the collection as a whole the number of hours between insemination and death afforded a measure of the progress of development. In specimens fixed in Perenyi's fluid the pronuclear chromatin particles tended to be larger than after other fixatives. In ova fixed in Perenyi and obtained late after insemination the particles specially tended to be large. In 31 out of 49 central pronuclei, non-basophilic particles were found, independently of fixative, of depth of staining and of time between insemination and death. These particles were significantly absent from peripheral pronuclei. Among pronuclei with chromatin accumulated chiefly near the outer membrane, there was a great proportion showing only basophilic particles. The condition of the pronuclear reticulum was independent of the stage of development and of the fixative, but Zenker-fixed specimens stained with Mayer's hemalum and eosin showed a definite tendency towards a fine reticulum. There was very little evidence to show whether actual fusion of pronuclei occurred. It was not possible to indicate the probable developmental processes in the ferret pronuclei by using information from other mammals. A definite spermatozoon tail was found in 1 ovum; the scarcity of such specimens probably being due to technical factors. One trinucleated ovum was found, attributed to double fertilization.—*D. Mainland.*

17386. **MASKELL, F. G. On the New Zealand lamprey, Geotria australis, Gray. Part 2. On the mid-gut diverticula, the bile duct, and the problem of the pancreas in the Ammocoetes stage.** *Trans. and Proc. New Zealand Inst.* 61 (3/4) : 478-497. 1 pl., 14 fig. 1930. —The *Ammocoetes* stage of *Geotria australis* possesses 2 forwardly directed intestinal diverticula, a left and a right. Into the left opens the bile duct. Such diverticula are unknown from other *Ammocoetes.* In the epithelial lining of the diverticula occur scattered glandular cells, which are compared with the exocrinous pancreatic cells of vertebrates on the basis of appropriate cytological studies.—*F. G. Maskell.*

17387. **ONO, KOSAKU. Untersuchungen über die Entwicklung der menschlichen Milz.** *Zeitschr. Wiss. Biol. Abt. B, Zeitschr. Zellforsch. u. Mikrosk. Anat.* 10 (3) : 573-603. 12 fig. 1930.—This study is chiefly concerned with the development of the vascularization of the spleen in general and of the Malpighian corpuscles in particular. Before the mesenchyme cells that form the primordium of the spleen begin to assume definitive characters, 2 veins penetrate the mass. Both are offshoots from the portal vein, one (primary) taking an independent course, with its branches parallel to the surfaces of the spleen, the other (secondary) accompanying the branches of the artery. The branches of the 2 veins anastomose, but no anastomoses of arteries with veins could be seen; a closed blood path was not to be seen at any stage of development. The mesenchyme is a reticular plasmodium and begins in the 5th month to assume the fibrous structure of the pulp reticulum. In the 4th month lacunae begin to appear in the reticulum adjacent to the branches of the venous plexus and these later become the venous sinuses. Hematopoiesis begins in the spleen with the formation of the lacunae, reaches its highest point in the 5th month and diminishes with the completion of the development of the venous sinuses. Lymphatic tissue first appears in the spleen in the 5th month, forming an adventitious coat for the arteries. About the middle of that month accumulations of lymphocytes begin to appear at points where an artery branches dichotomously. These accumulations are the primordia of Malpighian corpuscles. In the 7th month arterial branches form an outer plexus around each accumulation and still later an inner plexus is developed, its development being accompanied by the appearance of cleft-like spaces in the lymphatic tissue.—*J. P. McMurrich.*

17388. **ORRU, A. Costituzione chimica e struttura del guscio d'uovo di casuario. [Chemical constitution and structure of the egg shell of the cassowary.]** *Boll. Soc. Ital. Biol. Sperim.* 5 (2) : 172-176. 1 fig. 1930.—The egg shell consists of 19 layers, which consist alternately of organic and inorganic matter. The internal layers are colored by a green pigment. The organic matter consists of proteins; the inorganic matter is chiefly $CaCO_3$. —*M. Comel.*

17389. **POPOFF, N. Les glandes acineuses simples de la conjonctive palpébrale chez le foetus humain.** *Arch. Anat. Histol. et Embryol.* 11 (1/4) : 187-196. 2 pl. 1930. —The simple acinous glands of the conjunctiva are very precocious in development. They are present in the human fetus of 8.5 cm. (V-H) i.e., well before the appearance of the glands of Wolfring or of Krause. During the first stage of development the glands are of the mucous type. During later fetal life the goblet cells become less active, producing a close resemblance between the glandular and the conjunctival epithelium. At the same time, the glands elongate and become tubular. Without careful examination of serial sections these glands may be confused with simple invaginations or folds of the mucosa. These glands are similar to the glands of Henle.—*N. Popoff (transl. by J. E. Kindred).*

17390. **STEEN, J. C. van der. De ontwikkeling van de occipito-vertebrale streek van Microhyla. [The development of the occipito-vertebral region of Microhyla.]** [In Dutch, with German summary.] 160p. Dissertation, University of Leiden: Leiden, 1930.—This is a detailed investigation on the ontogeny of the skeletal elements of the occipital region: the trabecular and the basal plate, the arcus occipitalis; there is no mesotic cartilage and no preoccipital arcus. In the development of the vertebrae, the atlas is not double. An aberrant kind of cartilage is present, which is perhaps the cause of the miscarriage of Van Wijhe's method. Detailed description is given of the ontogeny of the soft parts: 3 prootic somites, the influence of the rostral displacement of the somites on their reduction and on that of the nerves of the head. There is remarkable reduction of the chorda. —*C. J. van der Klaauw.*

EXPERIMENTAL

17391. **ADACHI, AKIRA. Über die Züchtung von Linsenepithelzellen in vitro.** *Arch. Exp. Zellforsch. Bes. Gewebezücht. (Explantation)* 10 (4) : 437-441. 4 fig. 1931. —Eyes of 8-9 day old chicken embryos were enucleated,

the posterior surface of the vitreous exposed, the lens removed vertically, the anterior surface incised and small pieces of epithelium removed from the equator and explanted by Fischer's method. Epithelial growth began in 1-2 days; if elements of the capsule were transplanted they remained unchanged for a long time. The culture grew in a membranous layer toward the periphery, with numerous processes there. The cells were usually polygonal, the cytoplasm was granular, and the nucleus usually oval; the cells multiplied by mitosis. Fat granules appeared which the author attributed to the culture medium (plasma and embryo extract, not aqueous humor) and to changes in properties of the cells themselves.

17392. **ASMUNDSON, V. S. The formation of the hen's egg. Parts II and III.** *Sci. Agric.* 11(10): 662-680. 7 fig. 1931.—The following results of experiments show that both the isthmus and the uterus influence the shape of the egg: Eggs laid after the anterior half of the isthmus had been removed were, in general, more irregular in shape than eggs laid before the operation. A hen with isthmus torn longitudinally and the tear closed with catgut sutures subsequently laid eggs with characteristically wrinkled shells. Eggs with very little shell have the characteristic shape of normal eggs laid by the same hens. Interference with the isthmus resulted in the laying of abnormally shaped eggs for a time, with gradual return to the laying of approximately normal eggs. After removal of a piece 2.5 × 1.1 cm. from the ventral side of the uterus of a pullet, she at first laid a few eggs that were approximately normal in shape but later, eggs that were flattened on one side. Hens that were similarly treated except for the final operation on the uterus laid normally shaped eggs. An egg laid after cotton was placed at the sides of the uterus had a thin-shelled depression on one side. Eggs laid later had a depression reaching more or less around the egg. It is considered probable that the general shape of the egg is determined chiefly by the amount of albumen secreted, the caliber of the lumen of the albumen part and isthmus, and the muscular activity of the walls of these parts. Studies on the determination of the size of eggs showed that the relative variability in the weight of the parts of eggs as measured by the coefficient of variation was in inverse order to weight. Weight of egg was positively correlated with the weight of each of the parts, but weight of yolk was not correlated with weight of shell. The correlations between the parts of the egg indicate that the amount of albumen and shell depends to only a limited extent on the size of the yolk. A comparison of 15 bantam eggs with 60 eggs having yolks of the same weight, from ordinary hens, showed that the bantam eggs had less albumen and shell.—*From author's summaries.*

17393. **ASMUNDSON, V. S. The formation of the hen's eggs. Pt. IV.** *Sci. Agric.* 11(11): 755-788. 1 fig. 1931.—Dwarf eggs were obtained from 2 actively ovulating hens. One of these laid 7 such eggs, so spaced as to suggest that they resulted from normal ovulation, and an 8th which contained a vitelline membrane. The bird was killed after laying the last dwarf egg and yolk material was found in the body cavity. Three double-yolked eggs were laid by a hen after an artificial yolk had been inserted into its oviduct. Operations of the type used have, in other cases, resulted in temporary or permanent inactivation of the oviduct, hence it is probable that lowered physiologic tone of the oviduct was the cause, although the rate of ovulation was obviously higher than at other times. Three eggs with elongated stalks were obtained. One was a dwarf egg that resulted from the insertion of an artificial yolk. The other two had normal yolks but were laid by a hen that had been operated on twice and artificial yolks inserted, one of which had albumen and membrane secreted around it, while the other was expelled, without any egg envelopes, 2 days after it was inserted.—*Author's summary.*

17394. **BALINSKY, B. I. Ein Fall der abhängigen Entwicklung von Linsenfasern bei völligem Mangel eines Augenbechers bei Triton.** *Zeitschr. Wiss. Biol. Abt. D, Roux' Arch. Entwicklungsmech. Organ.* 122(1): 12-21. 5 fig. 1931.—The author describes a larva of *Triton taeniatus* from which it appears that in *Triton*, as previously shown by Dragomirow in Anura, 2 phases can be distinguished in the development of the lens: (a) the formation of a lentoid, i.e., of a small epithelial vesicle from the inner layer of the dermal epithelium, and (b) the metamorphosis of parts of these cells of the vesicle into lens fibers. The 1st phase of development can go on fairly independently if the future lens material possesses certain properties which may perhaps be received from the optic cup (induction of the lens through the optic vesicle). The 2nd phase, as in Anura, is always a dependent development. Without an external influence, the transformation of the cells of the epithelial vesicle to fibers does not take place. This influence is not peculiar to the optic cup—it can apparently be exerted through any nervous tissue (in the case mentioned, through a piece of tissue of the hypothalamus through the tissue of the olfactory organs).—*J. H. Welsh (from author's conclusions).*

17395. **BISCEGLIE, VINCENZO. Studi sui tessuti espiantati. I. Ricerche sulla morfologia e biologia delle cellule epatiche ed endoteliali in culture di fegato embrionale. [Explanted tissue. I. Morphology and biology of hepatic and endothelial cells in culture of the embryonic liver.]** *Arch. Exp. Zellforsch. Bes. Gewebezücht. (Explantation)* 10(4): 407-436. 13 fig. 1931.—Explants of liver from 5-8 day chick embryos gave rise to liver and endothelial cells; if embryos were 12 days old and more, the explants showed also fibroblasts. Migration of liver cells (40th hour of life on), proceeded in the form of a single-layered epithelial membrane of regular elements in contact with each other; the cytoplasm of which contained many mitochondrial granules. Often, numerous vacuoles appeared, especially in the peripheral cells of the invasion zone; isolated cells were short-lived. Binuclear cells were rare. In the majority of explants there was also proliferation of endothelium of the sinusoids, but in some cultures (those greatly diluted with embryonal extract), proliferation of liver cells occurred in pure culture. Liver cells divided by mitosis when the culture was taken from a 5 day embryo. Endothelial cells migrated much earlier than the liver cells—generally within the first 24 hrs. Some cultures showed pure endothelium in the 1st passage. These wandering elements tended to form elongated and rounded meshes, or else were separated from each other by narrow fissures. The chondrioma of the endothelial cells appeared predominantly as tortuous filaments. These endothelial cells divided mitotically and faster than liver cells. Division rate of either class of cells falls with age of embryo and with successive passages. Lengthened life of the culture seemed not to affect the structure of the liver cells. After the 5th-6th passage, rate of growth increased, however, and having reached the original rate, surpassed it. Since in the mixed cultures the endothelial cells showed a greater rate of growth in repeated passages than did liver cells, they finally appeared in pure cultures, but underwent various alterations assuming the appearance of fibroblasts; but since these did not form collagen fibers, a genuine and effective transformation of endothelial cells into fibroblasts was not demonstrated. On the other hand, after some time these cultures showed other elements, such as isolated amoeboid, and phagocytosing cells—true macrophages. Their origin must be traced back primarily to Kupffer cells, although it is possible that the endothelium of the sinusoidal-capillary vessels, as well as that of liver, participated in this formation to a limited degree.

17396. **BURNS, ROBERT KYLE Jr. The process of sex transformation in parabiotic Amblystoma. II. Transformation from male to female.** *Jour. Exp. Zool.* 60(3): 339-373. 7 pl., 7 fig. 1931.—In 29 cases of ♂—♀ parabiotic *A. tigrinum* larvae, varying in age, 5 pairs show the gonads of the ♂ in advanced stages of transformation to ovaries. This transformation is rendered possible by

the existence, in the young normal testis, of a peripheral germinal layer, the ♂ cortex, considered homologous with the true cortex of the ovary. In some cases this ♂ cortex, stimulated by the hormones of the ♀ partner, grows actively with concomitant regression of the medullary region of the gonad. This may result in a transformation so complete that large portions of the gonad are indistinguishable from normal ovary, while in other sections transformation is still in progress. The existence of the ♂ cortex, with its latent physiological capacity, indicates that the early ♂ gonad is a bisexual structure, with dual capacity, enabling it to transform into an ovary under suitable conditions. However, transformation from ♂ to ♀ occurs only in a small minority of cases, while in all others the ♂ dominates. Quantitative studies show that, where the ♀ dominates, a large volumetric preponderance of the ♀ gonads is always found, and is probably necessary. This preponderance is established early in development, and its origin may be fortuitous. The transformability of a testis may largely depend upon the relative amount of preexisting ♂ cortex.—*Author (courtesy Wistar Bibl. Serv.)*.

17397. **DETWILER, S. R. Heteroplastic transplantations of embryonic spinal cord segments in Amblystoma.** *Jour. Exp. Zool.* 60(2): 141-171. 12 fig. 1931.—When the brachial portion of the spinal cord of *A. trigrinum* embryos is substituted for the corresponding region in embryos of *A. punctatum*, the graft, in larvae 32-60 days old, shows complete regulation so as to correspond in size and cell numbers with this portion of the normal *punctatum cord*. The regulation occurs much earlier than with other heteroplastic grafts. Difference in size of corresponding cross-section areas between the normal spinal cords in *A. tigrinum* and *A. punctatum* larvae possessing extreme size contrasts is not so great as might be assumed. The greater volume and cellular production in the *tigrinum* cord as a whole as compared with the *punctatum* cord is an expression of the greatly increased length of the former. When the first 3 spinal segments of the *tigrinum* cord are substituted for the *punctatum* brachial region (3rd, 4th, and 5th segments), regulation does not occur. The graft undergoes extensive development in size and cell numbers. In this respect it behaves in a manner similar to the corresponding region of a *punctatum* cord when grafted homoplastically to the same position. Evidence is produced also to show that a *tigrinum* cord graft in the *punctatum* embryo grows with a greater velocity, in the early stages, than the host rate, but that complete regulation occurs typically by 30 days after the operating stage.—*Author (courtesy Wistar Bibl. Serv.)*.

17398. **GLICK, BENJAMIN. The induction of supernumerary limbs in Amblystoma.** *Anat. Rec.* 48(2): 407-414. 3 fig. 1931.—The transplantation of the nasal placode of *Amblystoma* embryos (Harrison's stage 29 ±) to a position 4 or 5 segments caudal to the forelimb rudiment has been followed by the development of a supernumerary limb or parts of a limb at the site of the graft in 34 out of 71 cases. The first sign of the "induced" limb appeared 6-18 days after the operation. The limbs ranged in structure from a single digital outgrowth to a short limb with as many as 11 digits. In all cases the limbs were smaller than the normal, but in several instances there developed essentially normal hands. Examination of the sections in several cases showed the nasal placode as a vesicular organ. The "induced" limbs possessed definite skeletal elements with atrophic muscular development.—*Author (courtesy Wistar Bibl. Serv.)*.

17399. **HEYS, FLORENCE. The problem of the origin of germ cells.** *Quarterly Rev. Biol.* 6(1): 1-45. 19 fig. 1931.—A critical survey of the literature is made. More recent investigations are discussed in 4 groups: (1) those which deny early segregation of germ cells; (2) those which admit early segregation but bring evidence that segregated cells are not definitive and degenerate to be replaced by epithelial proliferations; (3) investigations which have led to the conclusion that germ cells are segregated early and migrate to the site of the developing gonad to persist as definitive cells, but that their numbers are increased periodically by a proliferation from the epithelium; (4) those which indicate that the definitive germ cells are set aside at an early stage in embryonic development not to be replaced later by transformation of differentiated peritoneal cells, their numbers being increased only by mitotic divisions. The author's experiments on ovarian regeneration in rats consisted of 2 series: (1) 105 doubly-ovariotomized (210 operations), ranging in age from 10 to 200 days and (2), 108 rats (216 operations), all under 40 days of age. An attempt was made to determine the conditions under which the operator can be sure of complete removal and what bearing the age of the animal at operation has upon the certainty of complete removal. Autopsies of the 1st series showed 2.88% of regeneration among rats beyond 40 days of age at operation. In 2 cases histological study of the excised ovary demonstrated incomplete removal. In the 2nd series of operated rats (under 40 days) autopsy findings were entirely negative. The success of complete extirpation depends primarily upon the age of the animal at the time of excision. It was easily possible to be certain of complete removal of the ovary in rats under 40 days of age, and upon complete removal no regeneration occurred. The small amount of regeneration observed in these experiments was due to the difficulties inherent in a perfect ovariotomy, age being the determining factor, because of the lobulated condition of adult ovaries. In operations performed on very young rats when the capsule as well as the stalk of the ovary remained in place, ample opportunity was afforded for proliferation from the epithelium. If no regeneration occurs under these conditions, it follows that the epithelium cannot replace the excised ovarian tissue. In so far as these experiments bear on the problem of the definitive germ cells, they lend no support to origin from a peritoneal source.—*F. Heys.*

17400. **HORNING, E. S., and K. C. RICHARDSON. On the cytology and behaviour of endothelium during the process of de-differentiation in vitro.** *Arch. Exp. Zellforsch. Bes. Gewebezücht. (Explantation)* 10(4): 488-500. 3 pl. 1931.—Embryonic liver, which gives a sheet-like outgrowth of endothelial cells when cultivated in a medium of plasma and embryonic extract, was used. In early embryos, where the liver tissue has lately mobilized, the endothelium of the sinusoids de-differentiated, very readily and quite soon after explantation, into typical mesenchymal cells. The endothelial cells from older embryos underwent a similar change in vitro, but more slowly, while similar cells from 18-19 day embryos failed entirely to de-differentiate under the same conditions of an unchanged medium and showed merely typical degenerative changes without alteration in morphology. It is suggested that recently differentiated cells in an embryonic organ or tissue undergo a period of "unfixed" differentiation before finally becoming resistant to any change in their cytological characters. Cells explanted during their latent period of "unfixed" differentiation in the early embryo retrogress, after short periods in vitro, to a more primitive cell-type. Those near the conclusion of the latent period take longer to de-differentiate while cells "fixed" in their differentiation fail to respond to the factors incurring de-differentiation. Similar results were obtained with endothelium derived from the cultivation of vena cava in vitro. Although variations in metabolism may be the ultimate factors causing de-differentiation, as suggested by Child, cells apparently must be in their latent period of "unfixed" differentiation for these factors to operate.—*K. C. Richardson.*

17401. **HUNT, T. E. An experimental study of the independent differentiation of the isolated Hensen's node and its relation to the formation of axial and non-axial parts in the chick embryo.** *Jour. Exp. Zool.* 59(3): 395-427. 4 fig. 1931.—Chorio-allantoic grafts of isolated levels of the area pellucida of chick blastoderms in the definitive primitive-streak, advanced head-process, and 1-12-somite stages were studied. Results show that the node

level of each stage considered forms specific parts and is the only level of the primitive streak which has any marked capacity for differentiation. The primitive streak posterior to the node forms in each stage only non-specific structures, such as gut, cartilage, muscle, and integument, which are common to all levels of the embryo. The node in the definitive primitive-streak stage forms all levels of the brain, spinal cord, notochord, eye, epiphysis, hypophysis, heart, liver, mesonephros, and the non-specific structures. The node is thus considered totipotent to the extent that it has the capacity to differentiate structures representative of all levels up to and including the mesonephros level. In the head-process and somite stages the capacity of the node is progressively restricted. It no longer differentiates anterior parts, but the frequency of formation of trunk structures, such as spinal cord, mesonephros, and adrenal, is increased. Apparently, the principal rôle of the node is the formation of axial parts, i.e., neural tube and notochord. Consequently, the node is a center of development and essential to the formation of the embryo. Evidence given suggests that the head process induces formation of the medullary plate.—*Author (courtesy Wistar Bibl. Serv.)*.

17403. **NIVEN, JANET S. F. The repair in vitro of embryonic skeletal rudiments after experimental injury.** *Jour. Path. & Bact.* 34(3): 307-324. 1931.—The repair of the various constituents of embryonic avian and mammalian long bones and of Meckel's cartilage has been investigated by fracturing and incising them at various stages of development and then studying them in vitro. The results depend on the period of embryonic life at which injury is made. In 5-day avian long bone rudiments, complete repair of the cartilage of the center of the shaft takes place. At a slightly later stage (5½-day rudiments), the cartilage is incapable of proliferation and union of the fragments is brought about by: (a) rapid increase of the adjoining cartilage matrix, (b) restoration of continuity of the surrounding osteogenic tissue and mesenchyme, (c) frequent ingrowth of osteogenic tissue into the gap between the cut ends which sometimes results in the formation of osteoid tissue in this situation. Cultivation in vitro for 24 hrs. renders the cartilage of the center of the shaft incapable of repair. In the less differentiated peripheral zones of cartilage, the capacity for proliferation persists longer. During and after repair in vitro, normal histogenesis and morphogenesis continue. When 9-day avian rudiments are fractured repair of the bony cylinder takes place but the osteoblasts which wander into the gap bring about resorption of cartilage. The cells of Meckel's cartilage possess the capacity for proliferation for a longer period than the chondroblasts of the center of the shaft of a long bone rudiment. Later, however, they become susceptible to necrosis after injury. In embryonic mouse bones approaching maturity, repair of the cortical bone occurs by the agency of the osteoblasts. —*J. S. F. Niven.*

17405. **PASQUINI, P., e G. MELDOLESI. Ricerche sulla radio-sensibilità nello sviluppo delle ova d'Anfibi. I. Radiosuscettibilità differenziale dei vari stadi embrionali (Anuri). II. Alterazioni specifiche e malformazioni secondarie da radiosuscettibilità differenziale in Rana esculenta. [Action of radium on amphibian eggs. I. Differential susceptibility in the various stages of development. II. Specific alterations and malformations secondarily due to differential susceptibility in R. esculenta.]** *Atti R. Accad. Naz. Lincei Rend. Cl. Sci. Fis. Mat. e Nat.* 10(5/6): 298-306. 1 fig. 1929; 11 (7): 705-712. 4 fig. 1930.—The early gastrulation stages are the most susceptible. Small doses cause no histogenic changes but gradual inhibition of morphogenesis results. Cellular alterations, or "radiumkrankheit," the first type of radium effect, depends upon intensity of dosage; but the effects are less than the proportionate increase of dosage. The second effect, that of abnormal morphogenesis, depends on the stage of development. As gastrulation proceeds (with 25-26 mch.), the action of the radiation is elective for the neural tube.—*P. Pasquini.*

17406. **REIS, KAROLINE. Untersuchungen über das Verhalten der Transplantate larvaler Amphibienhaut auf Larven und auf erwachsenen Amphibien, mit besonderer Berücksichtigung der Metamorphose.** *Zeitschr. Wiss. Biol. Abt. D, Roux' Arch. Entwicklungsmech. Organ.* 122(3): 494-545. 31 fig. 1930.—Larval skin grafted on larval or adult salamanders undergoes metamorphosis. Metamorphosis also occurs in larval skin-grafts on animals just before and after metamorphosis, and on sexually mature adults (*Triton cristatus* and *T. taeniatus*). Similar results were obtained with axolotl skin on *Amblystoma* hosts. Both homo- and hetero-plastic grafts retain their species-characters regardless of the site of the transplant. The involution of the Leydig cells is taken as the criterion of metamorphosis in the graft. The fact that grafts of larval skin undergo metamorphosis when transplanted on mature amphibians shows that the factors controlling metamorphosis are retained in the body of the grown amphibian. The factors are not species-specific. Axolotl skin grafted on *Amblystoma* metamorphoses as a result of the action of factors present in the body of *Amblystoma*, though the larval axolotl control does not metamorphose. Metamorphosed and partially metamorphosed grafts remain unchanged for a year when grafted on neotenous forms, indicating that the process of metamorphosis is not reversible. Of the 2 cell-types in the larval skin of salamanders, one degenerates and is replaced by the other, which survives. Homo- and heteroplastic grafts on larval hosts, or hosts recently metamorphosed, retain their markings and color. On older and fully grown hosts, the grafts remain unaltered only a short time after metamorphosis; the homoplastic grafts losing their markings and color, and turning black; the heteroplastic grafts degenerating completely.—*Author's summary (transl. by H. L. Wieman)*.

17407. **WILLIAMS, ROY G. A study of the growth of a portion of the spinal cord following its early isolation from the central nervous system in the chick embryo.** *Jour. Comp. Neurol.* 52(2): 255-270. 8 fig. 1931. —Isolation of the lumbar enlargement in chick embryos at 56 hrs. of incubation was accomplished by removing the 19th to the 23rd segments, placing a mechanical block in the defect, and cutting off the tail below the 29th segment. When such chicks hatched, although they became rapidly paralyzed in extension, the legs responded to stimulation. The isolated segment showed the total number of cells to be reduced by 41.4%, the gray matter by 13.1%, and the white matter by 43.9%. The size relationship, shape, and distribution of the cells or the shape of the gray matter were not significantly affected. —*Author (courtesy Wistar Bibl. Serv.)*.

17408. **WINDLE, WILLIAM F., and ALBERT M. GRIFFIN. Observations on embryonic and fetal movements of the cat.** *Jour. Comp. Neurol.* 52(1): 149-188. 1931.—A series of cat embryos and fetuses, with circulation intact, was examined after sufficient time had elapsed following decerebration of the mother cats to allow for recovery from the ether anesthetic. The development of motility was followed from its earliest manifestation as a slight ventrolateral flexion of the cervical region in 16-mm. embryos to a time shortly before birth. The movements of embryos and young fetuses are, to a large degree, massive and generalized. With a few exceptions, there seems to be a gradual evolution or individuation of the more discrete unit reflexes from the total patterns. In some cases, however, reflex movements seem to make their appearance with little or no relation to the primitive behavioral background. In general, functional motor differentiation proceeds cephalo-

caudally and proximodistally, and is followed similarly by the spread of sensory reception areas or reflexogenous zones. It is believed that the behavior patterns of postural and locomotor reactions can be traced back to the early part of the 4th fetal quarter. Those for the feeding response may appear at a slightly later time. The fundamental background of all the distinctly purposeful responses of the newborn kitten is, however, more primitive and antecedes the appearance of reflexes. No conclusions as to the mechanisms involved were made on the basis of this purely physiological study.—*Authors (courtesy Wistar Bibl. Serv.).*

17409. WINDLE, WILLIAM F. The neurofibrillar structure of the spinal cord of cat embryos correlated with the appearance of early somatic movements. *Jour. Comp. Neurol.* 53(1): 71-114. 3 pl., 3 fig. 1931.—A general survey has been made of those nervous elements in embryonic spinal cords that stain by the pyridine-silver and Bielschowsky methods. The specimens were previously examined physiologically and their somatic motility determined. In the premotile specimens (10-14 mm.) all elements necessary for primitive reflex pathways were present, but almost all the sensory neurones were unassociated by means of collaterals with the mantle-layer neuroblasts. Well-formed sensory collaterals appeared at about the time motility was first observed (16 mm.), and there is a direct relationship between their number and size and the regions in which movements appear. The first reflex arcs to become completed seem to be the ones that, at a later time, function in the first ventrolateral neck flexion. Further growth follows the cephalocaudal plan, as does the development of motility. The development of other structures in the spinal cord has been traced and, when possible, it has been correlated with the appearance of movement. The relationship between certain morphological spinal-cord patterns and the types of early reflex responses has been pointed out.—*Author (courtesy Wistar Bibl. Serv.).*

ANOMALIES, MONSTERS AND MARKED VARIATIONS IN DEVELOPMENT

17410. BERNER, O. En maskulin og en feminin pseudohermafrodit. [A male and a female pseudohermaphrodite.] *Norsk Mag. Laegevidensk.* 90(3): 217-232. 9 fig. 1929.—The present work is a summary of a general survey prepared for Hirsch's "Handbuch der inneren Sekretion." The author describes how the ovary in the "free-martin" is converted into a testicle during development and he describes the conditions, in ♂ pseudo-hermaphrodites, of the interstitial cells, which often are characterized by features of the opposite sex. The doctrine that the interstitial cells determine the ♂ sexual characteristics therefore appears to have little foundation. The author briefly describes a case of ♂ pseudo-hermaphrodism in a swine and gives details of a case of ♀ pseudo-hermaphrodism complicated by various other anomalies in a 4 wks. premature child. The uterus was lacking and the genitalia externa consisted of a tiny "peniculum" and a wrinkled fold of skin which was diagnosed as a scrotum.—*Author's summary.*

17411. BOHÊME, P., et M. RIVALLAND. Les malformations congénitales de la valvule de Bauhin (rétrécissements et sténoses). [Congenital strictures of the ileocecal valve.] *Rev. Chir.* 48(7): 455-475. 1930.—Reports of 5 cases.

17412. BÓKAY, JOHANN von. Über Diphallie. *Jahrb. Kinderheilk.* 127(3/4): 127-136. 7 fig. 1930.—The author describes a case of a double penis in a 3 mos. old child. This anomaly was associated with total lateral epispadias and extraverted urinary bladder. He also discussed 8 cases of diphallus from the literature.

17413. BURG, ETE. Zur Frage der menschlichen Gürtelplacenta, im Zusammenhang mit dem pseudointermediären Blutkreislauf der einfachen und normalen Placenta. *Zentralbl. Gynäkol.* 54(7): 420-425. 6 fig. 1930.—The authors studied sections and x-ray films of injected human annular placentae. They found 2 complete circulations present and a 3rd partially developed which anastomosed with these.

17414. CLARK, H. C. Renal anomalies disclosed by autopsy. (4215 consecutive autopsies.) *United Fruit Co., Med. Dept. 18th Ann. Rept.* 271-285. 1929.—A congenital absence of a kidney was found twice in the series. Extreme congenital atrophy of one kidney, almost to the point of its absence, in 4 cases; marked congenital atrophy (a fibro-cystic mass of small size) in 10 additional cases and 6 extreme cases of congenital cystic kidneys forming large masses give a total of 22 cases; the change was limited to the right side in 8 cases, to the left side in 9 cases, and was bilateral in the others. "Horseshoe kidney" occurred 7 times, or about once in 600 cases. There is usually a marked malposition of the horseshoe or fused kidney to a position low in the abdomen over the psoas muscle groups or in the pelvis. Congenital dystopia of a kidney, either in a unilateral or its bilateral fused state, occurred 15 times. A low position in the right iliac fossa or over the right sacro-iliac joint was observed in 6 cases; and in 6 more cases, in a corresponding position, on the left side. The location 3 times was over the median line in the lumbar region or over the promontory of the sacrum. Thus there was 1 case in every 281 individuals showing a low malposition of one or both organs. No accessory kidney was encountered. The number of kidneys was reduced to 1, by fusion in 7 individuals and by congenital absence in 2 cases. Multiple ureters (unilateral or bilateral), going as far as the pelvic brim or sometimes as far as the bladder wall before fusion to empty as one normal channel, were found in 10 cases, and complete doubling of the ureter in 8 cases. Complete absence of a ureter was recorded in 2 cases; and extreme atrophy of a ureter in 8 more cases. Short ureters were associated with all cases of renal dystopia. In all, 40 cases presented some form of variation. The renal pelvis was frequently divided; and a given branch of the ureter would, therefore, drain only a fractional part of the kidney. About 1 in every 100 cases had some form of ureteral variation. Variations in number or origin of the renal arteries were noted in 40 cases but this by no means represents all that were present. There were 25 variations in veins found but these were practically associated with cases of renal dystopia. Anomalies were slightly more frequent on the left side than the right side; while in about $\frac{1}{5}$ of the series some form of a variation was bilateral. Some developmental defect in the system was found in 1.47% of cases. Race did not appear to be an important factor in the incidence of the anomalies. Nearly all the cases in the series were males and, therefore, little can be said as to sex incidence. 53 cases were in ♂♂ and 9 cases in ♀♀. Most of the individuals lived a normal length of time or died of disease or accident totally unrelated to the anomaly.—*From author's summary.*

17415. COBURG, HERMANN. Über angeborene Obliteration der grossen Gallenwege. *Frankfurter Zeitschr. Path.* 40(2): 281-297. 1930.—In a child 7 mos. old, the gall-bladder was absent and the bile ducts obliterated.

17416. DANFORTH, C. H. Developmental anomalies in a special strain of mice. *Amer. Jour. Anat.* 45(2): 275-287. 4 fig. 1930.—By selection there has been developed a strain of mice which gives a high percentage of young showing varying degrees of posterior duplication. The abnormal specimens vary from non-viable Y-shaped individuals, which are completely double posteriorly, to those with only a slight degree of doubling in the external genitalia. The prevailing type, the development of which has been traced from about the 10th day of gestation, presents a characteristic ontogeny differing widely from the normal in later stages, but which is apparently due to a very slight initial deviation. Associated with an early excess of tissue in the region of the future perineum and lower anterior abdominal wall there are 2 ventrolateral outpouchings of the cloaca, instead of a single median one. This is followed by the development of 2 distal parts of the urogenital tract. The rectum is usually single, the bladder commonly

somewhat double. There are 4 kidneys and occasionally 4 gonads. Two of the kidneys remain in the pelvis and fuse. More or less defective extra legs develop between the external genital openings. The type of symmetry is of especial interest and seems to depend on a direct influence (analogous to the "organizer" effect) of one part on another.—*Author (courtesy Wistar Bibl. Serv.).*

17417. **DIETRICH, A. Angeborene Knochenbrüchigkeit (Osteogenesis imperfekta) mit Besserung (durch Vigantol?).** *Virchow's Arch. Path. Anat. u. Physiol.* 275: 397-407. 3 fig. 1930.—The microscopic anatomy of the bones of a child of 10½ mos. is described. This infant had very fragile bones and an imperfectly formed skull. Administration of vigantol (Vitamin D) did not change the P or Ca of its blood, but apparently promoted bone growth, as determined clinically. Death was due to bronchopneumonia. There were some indications of enchondrial ossification in the joints and ribs, and some perichondrial bone formation.

17418. **DOLL, EDGAR A., and DOUGLAS P. MURPHY. A case of microcephaly following embryonic roentgen irradiation.** *Amer. Jour. Psychiatry* 9(5): 871-878. 1930.—Murphy had previously published studies on 74 full-term children irradiated in utero, of whom 25 (33%) were defective at birth, 17 being microcephalic. He here, with Doll, reports the case of a microcephalous child, irradiated before birth, born of superior parents and with 2 brothers and a sister above the average in mentality.

The question of the permeability of the placenta to maternal hormones is considered in the light of the possible result of placental infarction which normally occurs from the 5th month of pregnancy.—*H. A. Harris.*

17427. **HOFBAUER, J. Decidual formation on the peritoneal surface of the gravid uterus.** *Amer. Jour. Obstetr. & Gynecol.* 17(5): 603-612. 8 fig. 1929.—The author reports the finding of macroscopically evident deciduae on the posterior surface of the uterus in 15 out of 23 eclamptic patients at term. Similar areas were found in the inferior portion of the omentum near the pelvis (here the cells have a rich glycogen content and a tendency to vacuolize), in the mesenteriolum of the appendix, and also beneath the germinal epithelium of the ovary. Histologically these ectopic deciduae were characterized by great variation in the shape, size, and number of the component cells, which were grouped into layers, masses, or sheaths around blood vessels. The individual cells were spindle shaped, with dark oval nuclei and scanty cytoplasm. The peritoneal mesothelium seemed never to be involved in their formation. The formation of deciduae, both ectopic and normal, seems to be dependent on the presence of some principle which instigates the differentiation in the above tissues which are all from the same embryonic source and, therefore, presumably capable of a similar differentiation. This differentiation is: (1) of connective tissue cells (mesenchymal in potentialities) into decidual cells and sometimes into smooth muscle and (2) of uterine epithelium, peritoneal epithelium, and germinal epithelium of the ovary (the latter two ectopic) into decidual gland-like structures. The author's observations support the theory that the activating principle is a derivative of the anterior lobe of the hypophysis. It is suggested that the anterior lobe may exert an influence on the formation and function of the corpus luteum and upon ovarian function. Furthermore the author suggests that, due to the similarity of distribution and histogenesis, both ectopic deciduae and endometriosis may be considered from a common point of view. While implantation is accepted as the cause in certain cases of endometriosis, the author thinks that it is highly probable that a reflux of menstrual blood through the tubes into the pelvic cavity may be the etiologic element involved in many cases of endometriosis.—*From abstr. by H. Jordon.*

17428. **HOSOI, KIYOSHI. Teratoma and teratoid tumors of the brain.** *Arch. Path.* 9(6): 1207-1219. 4 fig. 1930.—The case here reported, showed derivatives of the 3 primitive germ layers. Clinically, the patient showed dwarfism, kyphosis, scoliosis, hirsutism, marked hydrocephalus and moronic feeblemindedness. He was never able to walk. The tumor probably originated from some misplaced tissue in the cerebellum.—*Author's summary.*

17429. **HOUCK, JOSEPH WILLIAM. Hydrocephalus in lower animals. Congenital occurrence in a calf and an albino rat.** *Anat. Rec.* 45(1): 83-106. 6 fig. 1930.—In the first case, a calf, killed at the age of 2 mos., the brain had been exceedingly disfigured in paradoxical relation to a history of normal behavior. Microscopic sections showed a minimal destruction of nerve elements, but an expansion and stratification of cells and fibers. Dilatation of the lateral ventricles was extreme, and the point of obstruction was in the 3rd ventricle; several factors may have been involved, as hydrocephalus constitutes a vicious circle. The pineal body was completely obliterated, and this fact is offered as further evidence of the functional unimportance of this structure. The hypophysis cerebri was flattened and the anterior lobe showed the signs of acromegaly. Other signs of acromegaly were noted. The posterior lobe was atrophied, and a peculiar cellular growth was found in the pars intermedia. The second case is a white rat, which died an agonal death at the age of 25 days. Pronounced signs of nervous derangement were noted before death. The brain was a miniature model of the hydrocephalic calf brain. The head and brain of the calf are described in detail and the general features of internal hydrocephalus are reviewed.—*Author (courtesy Wistar Bibl. Serv.).*

17430. **JANSEN, MURK. The large brain, the wide pelvic girdle and the outstanding number of hip anomalies in man. (Coxa vara, Coxa fracta, Coxa plana, Coxa valga, Slipping epiphysis, Malum coxae)** *Jour. Bone & Joint Surg.* 11(3): 461-531. 3 pl., 62 fig. 1929.—The author traces the above named conditions to purely mechanical

causes. Their frequent coincidence with congenital hip dislocation either in the same individual or in the same family, establishes their mutual relationship. Le Damany has presented evidence that congenital dislocation of the hip is due to smallness of the fetal envelopes causing excessive flexion in the hip through which the femoral head is levered out of its socket. Shallow socket or thick socket floor and anteversion of the femoral neck are the constantly attending phenomena. The above mentioned conditions are regularly accompanied by a flat hipsocket, i.e., a socket with a too thick floor or by a wide one, i.e., a hipsocket in which the ischial part has swung mesially (ischium varum). Not infrequently ischium varum is attended by congenital coxa vara, the obvious sign that undue pressure has acted in the direction of the femoral axis at the same time causing the femoral neck to bend and the ischium to swing mesially. Both the flattened hipsocket (through thick socket floor) and the widened socket (through ischium varum)—in the non-dislocated cases—are in contact with the upper portion of the femoral head alone, the lower mesial portion leaving a gap mesially between femoral head and socket floor; and the result is that a couple of forces comes into action striving to raise the femoral neck. The effect of abnormal forces acting on bone substance depends caeteris paribus on the condition of the bone substance, a fact which is often overlooked. The effect of the abnormal couple of forces will be different in the rachitic, the knock-knee child, the overgrown and the normal subject. In the normal subject with flat or wide hipsocket, the femoral head and neck remain unaltered until adult age, when malum coxae or osteoarthritis will develop due to the mere incongruence of the joint surfaces. In all other cases the couple of forces brings about rotation of the femoral head due to retardation of growth on the lateral side, greatest in the rachitic, least in the overgrown. In the rachitic, moreover, the femoral neck is bent, i.e., in the soft bony tissue, the body-weight predominates over the couple of forces; while in the overgrown the couple of forces raises the femoral neck into the valgus position. In the knock-knee child the neck is neither bent into varus nor raised into valgus position, but the femoral head is rotated into the horizontal position. It shows mesial flattening (jockey-cap shape), whilst the neck develops "a chin" on the mesial side obviously due to its preponderant growth there (initial stage of coxa plana). If at this stage the mesial part of the femoral neck (i.e., the "chin") has not yet gained contact with the mesial part of the socket, the horizontal component of the acting muscle forces will cause mesial displacement of the neck under the head. Disturbance of circulation ensues both in head and in neck, resulting in death of the head and traumatic plasticity of the neck. The head, in being revived, sustains absorption of lime salts, initiating its flattening and fragmentation (fragmentation stage of coxa plana) which leads to congruity with the hipsocket, while the plastic neck is widened and shortened. During the development of these changes the growth disc assumes the characteristic curved course parallel to the socket line. With the total revival of the femoral head and the blending of the fragments, coxa plana reaches its final stage. Whereas congenital coxa vara is usually attended by ischium varum, coxa valga is mostly associated with thick socket floor and hence with anteversion of the femoral neck as is a rule with complete congenital dislocation of the hip. This anteversion combined with the approximately upright position of the neck is likely to cause the condition known as slipping epiphysis, in which the femoral head rotates with its upper part backward around a transverse axis. The characteristic sailor's gait in coxa valga, i.e., the rotation of the pelvis round a vertical axis, is the obvious sign that the femoral neck knocks against the posterior border of the hipsocket at each normal hyperextension of the leg during walking. Hence this point of contact acts as a fulcrum above which the femoral head is levered forward and friction of the femoral head is caused against the socketroof which gradually loosens the head and finally allows the femoral neck to slip forward without it (slipping epiphysis). Thus the pathogenesis of the outstanding number of hip deformities finds a natural mechanical explanation which has not been produced by any hypothesis or theory hitherto brought forward.—*M. Jansen.*

17431. **JUNGHANNS, HERBERT. Die Spondylolisthese im Röntgenbild.** *Fortschr. Geb. Röntgenstr.* 41(2): 239-245. 12 fig. 1930.—By means of x-ray films and photographs of anatomical preparations the anatomical picture of spondylolisthesis of the 4th and 5th lumbar vertebrae is described. In all of the author's 30 cases of spondylolisthesis, he found a gap between the intervertebral processes, which he, in agreement with other investigators, considers a congenital abnormality. Trauma which, because of the joint gap formation, strikes the least resistant part of the vertebral column, is the first cause of slipping of the vertebral body relatively to the upper joint processes, whilst the joint processes, below and behind the joint gap and the spinous processes, retain their old position and relationship to the joint. The forward movement of the vertebral body results in a series of secondary changes of the intervertebral disc below the vertebra and of the neighboring vertebrae, i.e., decrease in size of the intervertebral disc, formation of an S-shaped intervertebral disc, condensation of the related vertebral spongiosa, production of indentations and extrusions of the vertebral borders and enlargement of the lumbo-sacral angle—*Author's summary.*

17432. **KENNEDY, H. N., and A. W. SMITH. An abnormal coeliac artery in the dog.** *Vet. Rec.* [*London*] 10(32): 751. 2 col. fig. 1930.

17433. **KIAZIM ISMAIL. Syndrome d'hirsutisme déterminé par une tumeur surrénale.** *Presse Méd.* 38 (18): 302-303. 3 fig. 1930.—A 4 yr. old boy for a year before his death in convulsion, had begun to develop general adiposity, and abnormal hairiness of face and body. At necropsy the external genitals were found to have the development proper to the age of 14 or 15; the abdominal organs were transposed in position, and the heart was on the right. There was a malignant tumor of the suprarenal (cause of the hypertrichosis) of cortical origin, with metastases to the lungs.

17434. **KLEMOLA, VALTO. Ein Dicephalusfall beim Kalb mit einigen seltenen Gefässanomalien.** [English and Finnish summaries.] *Ann. Soc. Zool.-Bot. Fennicae, Vanamo* 8: 48-67. 1 pl., 7 fig. 1929.—Hypothetical explanations founded on the ontogenetic development are formulated by writer to explain certain interesting anomalies appearing in a dicephalous calf. A median raised row of ribs between the spines is present, and its occurrence is considered normal for such individuals. Mechanical and anatomical reasons are given for its origin. Each individual possesses a complete pair of lungs and a heart, but there is only one, common, aorta. The actual portal vein system is entirely lacking, a unique anomaly, according to the author. The paper contains a detailed description of the many anatomical adjustments that have been rendered necessary by these and other anomalies.

Unfall-Chir.* 27(4): 551-595. 27 fig. 1929.—This is a study of the skeleton of the foot and tarsal bones in congenital and paralytic talipes calcaneus. The author finds that the changes in the bones correspond to the evident deformity.—*A. Ehrenfried.*

17436. **KUBO, HISAO. Beitrag zur Kenntnis der amniogenen Missbildung mit besonderer Berücksichtigung der Entstehung der amniotischen Verwachsungen.** *Virchow's Arch. Path. Anat. u. Physiol.* 276(2): 241-258. 8 fig. 1930.—Three monsters are described. The first had a frog head, with amniotic growths coming from both the head and the upper and lower extremities. It had a bilateral cleft palate; the oral cavity was only partially developed. There was aplasia of the right adrenal, underdevelopment of the left adrenal, almost complete atelectasis of both lungs, an open foramen ovale and an open

ductus Botalli. The 2nd fetus had growths of amnion from the head, which connected with a strand from the umbilicus. The 3rd fetus was an acranius with exencephaly, growths of the amnion to the meninges, hypoplasia of both adrenals, syndactyly of the right hand and complete atelectasis of both lungs. Amnion attachments to the fetuses occurred very early, certainly during the 1st or 2nd month. The author believes that extensive amniotic growths, amniotic bands and small adhesions are due to a disturbance in the development of the amnion itself.

17437. LAFF, HERMAN I. Unilateral absence of sigmoid sinus. *Arch. Otolaryngol.* 11(2): 151-157. 6 fig. 1930.

17438. LEECH, CLIFTON B. Congenital complete heart block. Report of a case with an associated patent ductus arteriosus. *Amer. Jour. Dis. Children* 39(1): 131-140. 4 fig. 1930.

17439. LINK, K. H. Zur Kenntnis der Lageanomalien der männlichen Keimdrüsen, insbesondere der Dystopia testis transversa. [Anomalies of position of the male sex glands, especially transverse malposition of the testis.] *Zeitschr. Urol. Chir.* 29(3/4): 175-186. 1930.—A case in a 1½ yr. old boy.

17440. LÖFFLER, ERNST. Über ortsfremde Zellen und Geschwülste im Hinterlappen und im Stiel der Hypophyse. *Virchow's Arch. Path. Anat. u. Physiol.* 274 (2): 326-349. 11 fig. 1929.—In both the posterior lobe and the stalk of the hypophysis large epithelial cells often occur as strays from the undifferentiated epithelium of Rathke's pouch or from the anterior lobe process. These cells readily degenerate and form pigment; they frequently proliferate to form adenomata of the hypophysis. Both cells and adenomata (20 cases of which are here described) are known in literature under various names: protoplasma-rich glia, neurogenic structures, choristomata, etc.

17441. LUNDH, GÖSTA. On the problem of the interstitial cells of the testes and their influence upon internal secretion. *Acta Obstetr. et Gynecol. Scand.* 9 (1/4): 315-330. 10 fig. 1930.—A quantitative microanalysis has been made of the different tissue-elements in the testes from 3 cases of so-called ♂ pseudohermaphroditism with cryptorchidism and from a normal 18 yr. old individual killed by accident. Two of the testicond cases showed a considerable increase in the absolute weight of the interstitial cells or the interstitial tissue in toto, while in 1 case the weight was about the same as in the normal testicles. The most notable feature was the great difference in the quantity of interstitial cells in the 2 last cases. In the first of these, which presented typically ♀ secondary sex-characters, there was if anything a slight reduction in the quantity of interstitial cells (or interstitial tissue as a whole) as compared with the normal case. The seminiferous tubules, however, showed strikingly good development with well-developed supporting cells and distinct signs of spermatogenesis with formation of spermatogonia. In the last case, which exhibited typically ♂ secondary sex-characters, there was an extremely vigorous increase in the interstitial cells, while the seminiferous tubules were completely atrophic, no trace of either spermatogenesis or supporting cells being discernible.—*Author's summary.*

17442. LUNDH, GÖSTA, und HJALMAR SJÖVALL. Zwei neue Fälle von "männlichem Pseudohermaphrodismus." I. Eine approximative Berechnung der absoluten Menge der interstitiellen Zellen in den beiden kryptorchen Hoden. *Jahrb. Morph. u. Mikrosk. Anat. Abt. 2, Zeitschrift Mikr.-Anat. Forsch.* 19(4): 602-632. 22 fig. 1930.—See preceding abstract.

17443. MEAD, C. H. A quantitative study in human teratology. *Human Biol.* 2(1): 1-33. 1930.—An analytic study of 2 human monsters, one a simple monster with marked disproportions in external form, and one a typical example of "Janus" of cephalothoracopagus monosymmetros. The methods of analysis include: (a) a comparison of individual measurements of the abnormal specimens with means (and their probable errors) of groups of "normal" specimens of approximately the same body length; (b) comparison of observed values with "normal" values obtained by the use of empirical formulae for various bodily dimensions; (c) graphic analysis, through comparisons of body outlines (constructed by means of empirical formulae from the various observed dimensions) with body outlines (constructed by means of empirical formulae) of corresponding normal fetuses; (d) comparisons of abnormal and normal facial areas by planimetric methods. The study indicates that: The simple monster followed the "law" of developmental direction, but that there was a marked dissociation of rates of growth of the upper and lower parts of the body. Although the rates of growth of the extremities were abnormal, the relative growth rates of their several segments were normal. The relative rates of ponderal and lineal growth of the simple monster were dissociated. The growth of the double monster followed the "law" of developmental direction, and the growth gradients of its component parts were practically identical. "Fusion" had little effect upon the development of the components, except in the regions of conjunction, which were definitely retarded. There was a marked reduction in body-mass-for-length of the 2 components. This paper is presented as an experimental study of the application of modern analytic and graphic methods to human teratology.—*C. H. Mead.*

17444. MEYER, HELLMUTH. Linsenmyopie durch kongenitale Mikrophakie. [Myopia from congenital microphakia.] *Klin. Monatsbl. Augenheilk.* 84(1): 525-531. 1 fig. 1930.—A case of an extremely rare anomaly.

17445. MORGAN, LAWRENCE O., and HUGH S. GREGORY. Pathological changes in the region of the tuber cinereum in idiopathic epilepsy. *Amer. Jour Psychiatry* 9(5): 805-816. 1930.—After referring to epileptiform seizures produced in dogs by experimental brain lesions in the region of the tuber cinereum, fully reported elsewhere, the authors describe pathological findings in 21 brains, mostly from cases of idiopathic epilepsy. Summarized, these are: shrinkage of the tuber cinereum and cell loss in the gray substance of the 3rd ventricle (greatest), nucleus tuberis lateralis and nucleus tuberomammillaris (least), with some degree of cell degeneration in the remaining cells of the groups in all cases; no correlation between the nature of the cause of death and the amount of cell loss; hyperemia in all but 1 brain, apparently regional in the tuber cinereum or at least most intense there, but entirely absent in the 2 control cases and in the 1 epileptic brain mentioned. These findings confirm the results of the experiments on dogs as pointing to the tuber cinereum as related to the cause of epilepsy.—*From author summary.*

17446. RENANDER, AXEL. Anomalies roentgenologically observed of the cranio-vertebral region. *Acta Radiol.* 10(5): 502-513. 2 pl., 8 fig. 1929.—The author describes 3 cases, roentgenologically examined, of posterior spina bifida of the atlas and an anomaly of the cranio-vertebral region; the latter was found, during preparation of the specimen, to be a ligamentous assimilation between the left arch of the atlas and the occiput. In one case there was a combination with an auditory nerve neurinoma, considered by the author to be an interesting parallel with previously observed combinations of posterior spina bifida in the lumbosacral region and Recklinghausen's complex.—*Author's summary.*

17447. RENANDER, AXEL. Entwicklungsstörungen der Wirbel. Somatoschisis. Hemispondylus. *Acta Radiol.* 10(6): 588-597. 2 pl., 3 fig. 1929.—The author describes 2 cases of congenital irregularity in the development of the spinal column. One case presented a morphologic variation, with formation of a somatoschisis; in the other, the deviation was numerical as well as morphologic, resulting in a supernumerary hemispondylus with an accessory rib. The author explains the variations as the result of disturbed development of the spine in its membranous stages, with faulty formation of the nu-

cleus, combined, in the 2nd case, with a hemimetameric displacement of the latter.—*Author's summary.*

17448. SÁNTHA, KÁLMÁN v. Über das Verhalten des Kleinhirns in einem Falle von endogen-afamiliärer Idiotie. (Zur Differentialdiagnose der Marieschen und der sonstigen endogenen Kleinhirnerkrankungen, nebst Beitrag zur Lehre der Diplomyelie.) *Zeitschr. Ges. Neurol. u. Psychiatr.* 123(4/5): 717-793. 28 fig. 1930.—The author describes a case of endogenous, segmental degeneration of the cerebellum in an idiot with a double spinal cord. The author believes that the doubling was produced very early in embryonic life when the spinal cord was folded off from the skin ectoderm and instead of 1 neural layer as is normal, 2 layers were formed. The author separates idiocy into 2 groups, exogenous, which arises from some disturbances in placental circulation, and endogenous, which is always ectodermal and represents either a failure of the ectoderm to develop at all, or a development of the ectoderm in early embryonic life, followed by its degeneration in later embryonic life. Familial and non-familial idiocy could not be distinguished anatomically, but only from a knowledge of ancestry.

17449. SARVAAS, G. J. du MARCHIE. Über einen Fall von teratoider Neubildung der Hypophysengegend. *Frankfurter Zeitschr. Path.* 40(2): 210-223. 6 fig. 1930.—The tumor (in a 12 yr. old boy) contained connective tissue, pigment-containing glia, bone, cartilage, blood-vessels, fatty tissue and smooth muscle; it showed a slight tendency to organ formation, displaying brain tissue with glia and blood-vessel plexus, and an indication of a trachea with mucous glands and cartilage in the wall.

17450. SCHUMACHER, OSKAR. Weitgehende Asymmetrie des Sinus sphenoidalis. *Anat. Anz.* 68(18/21): 419-423. 1 fig. 1930.

17451. SHORE, L. R. A report on a specimen of fused pelvic kidney found in a Bantu of South Africa. *Jour. Anat.* 64(3): 344-352. 5 fig. 1930.—This rare specimen exhibited the conditions of multiplicity, fusion, and ectopia. The kidney was moulded on the promontory of the sacrum. Two ureters, but the rudiments of 4 kidney pelves, were present. The condition suggested an origin from: (1) a caudal and cranial duplication of the metanephros, (2) fusion of the upper and lower metanephric elements of each side, (3) fusion between the 2 upper metanephric elements in the mid-line of the body. The blood supply was from the middle sacral artery and the 2 internal iliac arteries. The paper concludes with some statistics of the occurrence of congenital abnormalities of the kidney in Bantu natives, Eurafricans and Europeans. It cannot be inferred that one race is more prone than another to congenital abnormalities of the kidney.—*L. R. Shore.*

17452. SOMMER, RENÉ. Zur nichttraumatischen Teilung der Kniescheibe (Patella partita). *Grun's Beitr. Klin. Chir.* 148(1): 1-26. 20 fig. 1929.—The author describes 3 types of split knee cap, that with small pieces in the external upper quadrant being the most common. Histologic study showed that the divided knee cap which had divisions in the upper external quadrant was the result of imperfect union of ossification centers. Other types of divided knee cap were associated with general faulty bone development but were often present in robust individuals. The author ascribes the formation of a split knee cap in an adult to a pseudo-arthrosis and not to osteochondritis desiccans.

17453. SONNTAG. Weiteres zur Fabella. *Deutsche Zeitschr. Chir.* 223(4/5): 359-367. 5 fig. 1930.—The author describes a case of median fabella from x-ray findings. He summarizes anomalies of the fabella in the literature of 1690 knee anomalies; bilateral fabella anomalies are 6-7 times more frequent than unilateral.

17454. SPESCHILOW, P. W. Über die Varietäten der Aortenbogenzweige. (Anormaler Ursprung der A. subclaviae dextrae.) *Zeitschr. Kreislaufforsch.* 22(2): 41-69. 4 fig. 1930.

17455. SPRONG, DAVID H. Jr., and NORMAN L. CUTLER. A case of human right aorta. *Anat. Rec.* 45(4): 365-375. 3 fig. 1930.—A case of right aorta in a white ♂, 50-60 yrs. old, is described. The heart is normal. The order in which the branches arise from the aortic arch is just the reverse of normal. The relative sizes of the right and left bronchi are reversed, and both right and left eparterial bronchi are present. The thoracic duct is on the left. There is no inversion of other structures. One hundred cases of right aorta, from the literature, are found to fall into 4 groups: (A) Situs inversus viscerum, 46%. (B) Right aorta, without inversion of other viscera: (*a*) Double aorta, 15%. (*b*) Right aorta, giving off left carotid, right carotid, right subclavian, and left subclavian, 26%. (*c*) Right aorta, giving off left innominate, right carotid, and right subclavian, 13%. A short discussion of the embryology is given, and it is suggested that mechanical factors during development may be responsible for the condition of right aorta.—*Author (courtesy Wistar Bibl. Serv.).*

17460. BUDDENBROCK, W. von. Beitrag zur Histologie und Physiologie der Raupenhäutung mit besonderer Berücksichtigung der Versonschen Drüsen. *Zeitschr. Wiss. Biol. Abt. A, Morph. u. Ökol. Tiere* 18(4): 701-725. 14 fig. 1930.—The so-called Verson's glands of Lepidoptera fall into 2 functionally sharply distinct portions: (a) the canal- and intermediate cells are skin-glands, which discharge their secretion to the exterior through an always visible duct, which passes through the cuticula to the exterior. The nature and use of the secretion are unknown. (b) the large inner gland cell has no outlet, and is to be considered an organ of internal secretion. Correspondingly, the inner cell precedes all other organs in its development between 2 molts. The discharge of the secretion vacuoles of the large gland cells takes place, not as has been supposed at the beginning, but only at the end of the molting process, after the formation of the new cuticula. The secretion of the molting fluid takes place not from special gland-cells, but from the epithelial cells themselves. The enlargement of the epidermal cells which are to secrete the new cuticula is caused, in the tracheae, by the pressure of the molting fluid, but on the hypodermis through the formation of temporary projections (rugosities) on the general surface.—*Author's summary (transl. by W. T. M. Forbes).*

17461. DAUTERT, E. Die Bildung der Keimblätter

von Paludina vivipara. *Zool. Jahrb. Abt. 2, Anat. u. Ontog. Tiere* 50(3): 433-496. 18 fig. 1929.—The egg cell of this ovoviviparous snail is remarkably small and contains little yolk. The first 4 blastomeres are equal and orient themselves crosswise. In the 8 cell stage, the difference in size between micromeres and macromeres is not great. In the 16 cell stage, the micromeres divide unequally but the macromeres divide equally, so that the cells of the second quartet are as large as the macromeres. Gastrulation is by invagination and takes place just after the 64 cell stage; the primitive ectoderm is derived from the first 3 quartets; and the blastopore becomes the anus. The mesoderm arises by proliferation from the anterior ectoderm below the velum; this region may be traced back to the second and, in part, to the third quartets. It is thus ectomesoderm and homologous with larval mesenchyme of many mollusks and annelids. On the other hand, teloblastic formation of mesoderm was not observed.—*H. B. Baker.*

17462. **EPURE, E., et V. POP. La structure de l'épithélium pulmonaire chez Helix pomatia L.** *Bul. Soc. Ştiinţe Cluj* [*Rumania*] 5(Fasc. 3, Part 2): 65-70. 1 pl. 1930.—The pulmonary epithelium of *H. pomatia* shows modifications analogous to those in vertebrate lungs. In both cases, the blood is restricted to capillaries and thus is separated from the intrapulmonary air by 2 cell layers, epithelium and capillary endothelium.—*H. B. Baker.*

17463. **LEOPOLDSEDER, FERDINAND. Entwicklung des Eies von Clepsine nach Entfernung des vegetativen Polplasmas.** *Zeitschr. Wiss. Zool.* 139(2/3): 201-248. 25 fig. 1931.—The egg of *Clepsine* [*Glossiphonia*] continues to segment normally after removal of the vegetative pole substance. A morphological but not a physiological mesodermal germ band is formed but is incapable of differentiation. All eggs die before the formation of the ectodermal germ band. These facts are in harmony with the results of Crampton on *Ilyanassa* and of Wilson on *Dentalium*. How the egg behaves after removal of the plasm of the animal pole is not yet clear.—*F. Leopoldseder* (*transl. by J. P. Moore*).

17464. **MURRAY, MARGARET R. In vitro studies of planarian parenchyma.** *Arch. Exp. Zellforsch. Bes. Gewebezücht.* (*Explantation*) 11(4): 656-668. 3 pl., 4 fig. 1931.—Planarian cells cultivated for several days in vitro become polarized and put out processes resembling those of nerve cells. Comparisons between such parenchyma cells and planarian nerve cells shows no sharp distinction between the two. It is suggested that in the regeneration of the cephalic structures of the planarian, the new nerve tissue may be derived from common parenchyma cells.—*Author's summary.*

17465. **PANNING, A. Über die Kristalloptik der Kalkkörper der Seewalzen.** *Zool. Jahrb. Abt. Allg. Zool. u. Physiol. Tiere* 49(2): 205-230. 13 fig. 1931.—The calcareous bodies of holothurians are lime-spar crystals, the chief axis of which corresponds either to the long, or to the transverse, axis of the calcareous body. In the first case, the meshwork is formed by repeated branching at 120°; in the second, at 90°. Both patterns are attributable to the laws of crystallization. By numerous examples, it is now proved that the form of the calcareous body has nothing to do with the fundamental structure, i.e., with type of branching and crystal orientation. Calcareous bodies built up in either of these fundamentally different arrangements are identical. The organic form is therefore independent of the crystalline. The following species were examined: *Holothuria arguinensis, H. impatiens, H. pardalis, H. poli, H. tubulosa, H. vagabunda.*—*A. Panning* (*transl. by J. H. Gerould*).

17466. **PFLUGFELDER, OTTO. Histogenetische und organogenetische Prozesse bei der Regeneration polychaeter Anneliden. 1. Regeneration des Vorderendes von Diopatra amboinensis Aud. et M. Edw.** *Zeitschr. Wiss. Zool.* 133(1/2): 121-210. 2 pl., 49 fig. 1929.—A description of *D. amboinensis*, including general morphology, anatomy, histology, habits. In the regeneration of the anterior end there are considered general features, histological details of the nervous system, muscles, coelom, and circulatory systems, regenerative organogeny of tentacles, parapodia, gills, origin of the sense cells and the free nerve endings. The author is interested in these phenomena from the causal-analytical standpoint and throughout considers the factors involved. Two formative groups of components are thought to influence the formation of tentacles, parapodia, and gills: (1) pressure of fluid (blood or coelomic fluid) combined with the pressure of accumulating cells; (2) formation of fibers which owe their origin to the first group but which from the first exert a directive pressure. Heredity as a causative explanation of regenerative phenomena is considered insufficient since in the last analysis this also must represent conditions that need explanation from a physical-chemical standpoint.—*F. H. Krecker.*

17468. **ROSS, L. S., and ROYAL R. TASSELL. Tracheation of grasshopper nerve ganglia.** *Jour. Comp. Neurol.* 52(2): 347-349. 2 pl. 1931.—The study of 4u sections of nerve ganglia of the grasshopper, prepared with the AOB method, demonstrates the passage of great numbers of tracheae and tracheoles through the punktsubstanz of the ganglia and of a very small number through the cytoplasm of an occasional cell. This is believed to be the first record of the presence of air passages within a nerve cell.—*Authors* (*courtesy Wistar Bibl. Serv.*).

17469. **RUNNSTRÖM, JOHN. Über Selbstdifferenzierung und Induktion bei dem Seeigelkeim.** *Zeitschr. Wiss. Biol. Abt. D, Roux' Arch. Entwicklungsmech. Organ.* 117: 123-145. 12 fig. 1929.—Studies were made on the development of the eggs of *Paracentrotus lividus, Psammechinus microtuberculatus* and *Sphaerechinus granularis* in seawater containing LiCl and KCl. The position of the larval processes appears to be independent of the skeleton, but without the skeleton the processes are barely indicated on the ciliated bands. There is apparently a primary induction, active in the uncleaved egg, and a secondary induction which is active much later. The primary skeleton, the triradiate rod arises independently of the ectoderm but the latter influences the later development into more complicated structures. —*E. Deichmann.*

17470. **SEIDEL, FRIEDRICH. Untersuchungen über das Bildungsprinzip der Keimanlage im Ei der Libelle Platycnemis pennipes I-V.** *Zeitschr. Wiss. Biol. Abt. D, Roux' Arch. Entwicklungsmech. Organ.* 119: 322-440. 62 fig. 1929.—This paper traverses much of the ground covered by 3 papers by the same author in Biol. Zentralbl. 1926, 1928, 1929, (for the first of which see B. A. 3 Entry 9912). While not all of the contents of the earlier papers are given in the present abstract, no attempt has been made to avoid all repetition. *Platycnemis pennipes* eggs are here studied as examples of non-determinative development for the analysis of determinative phenomena in insect embryos. Copulatory and egg-laying positions of the adult are described; the male holds the female during oviposition, which in the vicinity of Berlin occurs from June to August; 1 ♀ can lay 100-150 eggs in 1 hr. The normal development of the egg is described*. The egg is .9 × .2mm., bilaterally symmetrical, dorsal side almost flat, ventral curved. At the 64-nuclei stage of cleavage, nuclei begin to wander toward the egg-surface. The distance between nuclei in surface view can be used as a recognition mark of a given stage. Formation of the germ-band begins, at about the 650-nuclei stage, in the posterior half of the egg by wandering of nuclei from the anterior half. Two lateral nuclear fields are formed which later fuse on the dorsal surface from behind forward, but remain unfused

at the anterior end as the 2 head lobes. Emphasis is laid on observed variations, in extent, in time and in different lots of eggs, in the formation of these lateral fields*. The hind end of the germ-band sinks into the yolk, thus beginning the formation of the amnion, while the head lobes remain on the surface of the yolk. As sinking of the hind part into the yolk progresses, the point where the insinking occurs shifts forward. Revolution ("Wiederausrollung") of the embryo occurs after a break in the embryonic membranes and occupies 6 hrs. The embryo turns on its long axis 180° and moves so as to bring its ventral surface on the curved side of the egg. The chorion undergoes an alteration in size. The period of histological differentiation now succeeds; the chief external and internal organs are described; each eye at hatching possesses 7 facets, the number of which is increased at the moultings "der geschlüpften Imago" [error for "Larve" ?, p. 348]. The advantages and disadvantages of ligaturing eggs and burning parts of them for experimental purposes are discussed. The mortality in ligaturing is very great, amounting to about 50%. Fixation methods are given. Pages 350-373 form part II: Experiments proving the dependence of the different regions of the egg on each other. These are ligaturing the egg, already described in part in the author's paper of 1926 (B.A. 3, Entry: 9912) and its conclusions are reaffirmed. Part III (pp. 373-414) is the demonstration of a center in the egg on the activity of which the origin of the germ-band depends. Further experiments in ligaturing and in burning the hind pole are compared. Destruction, or exclusion by ligature, of more than about 96μ of the posterior end prevents formation of the germ-band, but the extra-embryonic blastoderm and yolk cleavage occur as in the anterior part of an uninjured egg. It is provisionally concluded that the formative center ("Bildungscentrum") is located at the hind end of the presumptive germ-band or extends from the posterior egg pole thence. This center retains its general situation from the 2-nuclei stage up to about that of 256-nuclei, that is, up to the early blastoderm stage. From experiments on eggs of greater age, chiefly by burning, and from various defective embryos so produced, it is deduced that in the late blastoderm stage, before the assembling of the nuclei to form the germ-band, removal of parts of the hind end of the egg no longer hinders formation of the germ-band and that, from this stage on, general body formation, i.e., of head from the fore part of the germ-band, of thorax from its middle part, of abdomen from its hind part, proceeds separately and in each part independently of the formative center located at the hind pole of the egg. These conclusions are strengthened by burning the anterior egg pole, at periods from 10½ to 40½ hrs. after the 4-nuclei stage, which does not hinder the formation of the germ-band, nor do lateral burnings have this result. In part IV (Cessation of the action of the formative center, pp. 414-426), graphs are presented showing that the curve which passes through eggs in which a germ-band is developed, after burning to graded distances from the hind end of the egg and at increasing lengths of time after the 4-nuclei stage, is an ascending curve; that this curve rises more slowly at a lower (17.9° C.) than at a higher (25° C.) temp.; that at lower temperatures complete embryos arise in later stages and after longer parts of the eggs have been burned than in earlier stages, while at medium and higher temperatures the length of the part burned (of an egg which can still give rise to a complete embryo) is approximately constant throughout the experiment. The conclusions drawn with respect to these results are: Without the formative center, origin of the germ-band is not possible. The ability of definite parts of the germ to assure by their presence the origin of a germ-band is transferred from the formative center at a definite time to parts lying ever farther forward. These parts acquire with this transfer, as far as the general form of the body is concerned, the possibility of carrying through the differentiation of the germ band independently of the formative center. In part V (Discussion of the formative principle of the germ-band, pp. 427-438), it is held that the experiments of incompletely ligaturing the egg leave such a microscopically small canal connecting anterior and posterior parts of the egg that no nucleus can pass through it, although its existence permits the origin of the germ-band which lies anterior to the ligature. The factors which can pass through this narrow canal are, therefore, not necessarily bound to nucleus or plasma. Destruction by burning of the formative center results in a diminution of the number of blastoderm nuclei, due to the absence of heterochronous nuclear divisions which normally give rise to the germ-band. Hence, without the action of the formative center, the differential increase in the cells necessary to the formation of the germ-band does not occur, nor does the assembling of the cells into the bilateral longitudinal fields. The cells do congregate, however, chiefly on the flat dorsal side. The formative center, therefore, does not give the impulse to cell movement as such, nor to the general direction of this movement, but a general disposition exists in the blastoderm cells to form the germ-band. Splitting of the egg-material in the blastoderm stage gives rise to dwarf double structures (Seidel, Biol. Zentralbl. 49, 1929); the hind end of one partner can lie far forward of that of the other. A special disposition of the parts of the germ for the formation of the germ band is, therefore, not present. Along with the independence in its mode of origin which the germ-band acquires in late blastoderm stages, it acquires also the ability of differentiation, but this is not true in every respect. Some of the experimental results obtained with *Platycnemis* are to be designated as true regulatory phenomena, others as alterations of the normal growth processes.—*P. P. Calvert.*

17471. TAYLOR, C. V. Polarity in normal and centrifuged eggs of Urechis caupo Fisher and MacGinitie. *Physiol. Zool.* 4(3): 423-460. 6 fig. 1931.—The eggs of this echiuroid worm are shed in the germinal vesicle stage and normally remain so until fertilized. They have no mark of polarity previous to polar-body formation. In normal and centrifuged eggs, the first cleavage plane is predictably defined by the position of the polar bodies and the sperm entrance point. Gastrulation is diametrically opposite the polar cells, irrespective of the stratification axis. A centrifugal force of 4800 × gravity was applied from 1 to 18 hrs. Stratified eggs are conveniently demarcated into hemispheres: the centrifugal hemisphere of hyaloplasm with clusters of red granules near the pole, and the centripetal, opaque hemisphere having yellow and brown strata and a polar, black cap. The germinal vesicle abuts against the yellow stratum, but the nucleolus is driven centrifugally. During development of centrifuged immature eggs: (*a*) the occurrence of polar cells on the hyaline hemisphere increases with prolonged centrifuging proportional to the displacement of hyaloplasm by strata in the opaque hemisphere; (*b*) the polar cells are rarely extruded from and sperm do not enter the region of the black cap; (*c*) the amphiaster is undeveloped or abnormal adjacent to the yellow stratum; (*d*) the cleavage plane advances far into the hyaline hemisphere before appearing in the opaque hemisphere; (*e*) if fertilization is long delayed, the stratified inclusions redisperse, the hyaloplasm recedes, and polar-body distribution approaches normal. The point of view adopted identifies the hyaline substratum as protoplasm to which are assigned the place and rôle of organic differentiation.—*Author* (*courtesy Wistar Bibl. Serv.*).

17472. TIRELLI, MARIO. Sbocco dei canali malpighiani nell'intestino medio. [Opening of the malpighian tubules in the mid-intestine.] *Boll. Mus. Zool. e Anat. Comp. Univ. Genova* 9(30): 1-18. 3 fig. 1929.—In the larvae of the *Cloëon dipteron*, the malpighian tubules open in the mid-intestine (not in the post-intestine, or between the mid- and post-intestine) directly, and certainly not far from the pylorus.—*M. Tirelli.*

17473. TIRELLI, M. Sbocco di tubi malpighiani nel

mesointestino. *Atti R. Accad. Naz. Lincei Rend. Cl. Sci. Fis. Mat. e Nat.* 10(5/6): 278-281. 1 fig. 1929.—See preceding abstract.

17474. **WERMEL, JULIUS, (unter Mitwirkung von G. W. LOPASCHOV). Über den Einfluss der Regeneration und Überernährung auf die Siphonenlänge bei Ciona intestinalis L. Ein Beitrag zu Kammerers Experimenten.** *Zeitschr. Wiss. Biol. Abt. D, Roux' Arch. Entwicklungsmech. Organ.* 122(1): 22-47. 4 fig. 1930.—Regeneration without elongation of the siphons of the Murman race of *C. intestinalis* (v. *canina* Müll.) takes place in about a month after a single amputation; there is no elongation after 48 days of over-nutrition. With over-nutrition regeneration of both siphons, without elongation, occurs in 32 days. The author states that deviation in his results from those of other experimenters (Mingazzini, Loeb, Kammerer, Fox) may have been due to variations in the material and the experimental conditions such as: age and race of specimens, composition and amount of nutrition, temp., number of amputations of the siphons, etc. He believes that the statements of Fox are insufficient to refute Kammerer's claims. Relative length of the siphons alters with age, length decreasing; it also varies locally, as in 2 different parts of the Gulf of Kola the relative length of the siphons of *Ciona intestinalis* differs. From their nature, Kammerer's experiments can not be repeated in another place.—*From author's summary (transl. by J. A. Bauer).*

17475. **WOODS, FARRIS H. History of the germ cells in Sphaerium striatinum (Lam.).** *Jour. Morph. and Physiol.* 51(2): 545-591. 54 fig. 1931.—Study of living and sectioned material throughout the life cycle shows that the germ-cell history, from fertilized egg to sexual maturity, can be divided into the following 5 periods with definite limits: Original appearance during cleavage, period of inactivity, period of multiplication, maturation, and fertilization. Primordial germ cells of characteristic structure can be recognized just before gastrulation, when there is one large germ cell in the mass of mesoderm on either side of the bastocoel. After one division in each of these 2 cells, the 4 daughter cells remain inactive, while the remainder of the mesoderm differentiates, until division is resumed in the developing gonad. An indefinite number of gametes is produced. All are direct descendants of the 2 original primordial germ cells. Transformation of somatic cells into germ cells does not occur, nor do germ cells become somatic cells. Cell lineage shows the 2 primordial germ cells to be derived from the 3rd division of the paired mesoderm cells which have arisen by an equal division of the 4th micromere produced by cell D of the 4-cell stage. Details of meiosis have not been ascertained, because of the small size of the chromosomes, their large number, and the difficulty of fixation. Nothing forecasts which primordial germ cells will become ova and which spermatozoa.—*Author (courtesy Wistar Bibl. Serv.).*

17481. **IVANIĆ, MOMČILO. Zur Auffassung der Kernverhältnisse bei Stentor coeruleus und Stentor polymorphus, nebst Bemerkungen über einige Kernverhält-**

nisse bei Infusorien im allgemeinen. *Zool. Anz.* 66 (1/4): 55-64. 2 fig. 1926.—The author briefly describes what he calls a "palmella-stage" in the life history of *Stentor*, because of its resemblance to the stage of the same name in the flagellates. Although Stein described and figured a cyst stage in *Stentor*, no other investigator has ever seen one and the present author apparently believes that the palmella-stage corresponds to the cyst stage of Stein. The changes undergone by the animal while in the palmella-stage are similar to those which other infusoria experience when in the cyst. All cilia are lost, and the cytostome and other organelles associated with food-getting also disappear, to be later regenerated. The members of the macronuclear "rosary" coalesce and the micronuclei behave in similar fashion, so that a single conspicuous micronucleus is formed. Division of the latter by a sort of primitive mitosis initiates the division process, and the macronucleus follows suit, but amitotically. Sometimes two divisions occur so that 4 individuals are found in a single palmella-stage. A discussion of nuclear conditions observed by other investigators in other infusoria concludes the article.—*R. D. Manwell.*

17482. **KOFOID, CHARLES A., and ARTHUR S. CAMPBELL.** A conspectus of the marine and freshwater Ciliata belonging to the suborder Tintinnoinea, with descriptions of new species principally from the Agassiz expedition to the eastern tropical Pacific 1904-1905. *Univ. Calif. Publ. Zool.* 34: 1-403. 697 fig. 1929.—This is a monographic treatment of synonymy, morphology, classification, relationships, and general distribution of the families, genera, and spp. of the suborder Tintinnoinea. The material examined was collected at 129 record stations in the eastern tropical Pacific, and in daily collections by the senior author in a traverse of the Pacific and Indian Oceans during 1916. This conspectus gives a complete revision of all spp. of the Tintinnoinea in literature up to 1929, with a total of 1750 systematic names, including a bibliographical synonymy of each sp. A bibliography of 256 titles is included. A total of 51 genera and 703 spp. including *nomina nuda* are recognized. Each family and subfamily is given a brief diagnosis and its relationships are discussed. Each genus, whether old, emended, or new, is also diagnosed and its relationships are briefly indicated. Types are designated for all of the 51 genera. The new spp., those given new names, and those raised to new status from subspecific or other rank, are briefly described, their relationships being indicated, and type locality and general distribution being given. Every sp. is figured either from the authors' material, or from the type drawing. Biological data are briefly given. The new groups and forms include 1 suborder, 10 families, 8 subfamilies, 23 genera, and 276 spp. [Type dep. not given]. **TINTINNOINEA** (p. 8), n. suborder of Heterotrichida, including all the families treated in this paper. **TINTINNIDIDAE** (p. 9), erected for *Tintinnidium* Kent and *Leprotintinnus* Jörg. (p. 309). There is a systematic index to families, subfamilies, genera, subgenera, spp., subspp., and forms. There is an errata list.

17483. KUDO, RICHARD R. Handbook of protozoology. 451p. Charles C. Thomas: Springfield, Illinois, 1931. Price $5.50.—Provides an authoritative, concise handbook of introductory information on the common and representative genera of all the groups of free-living and parasitic Protozoa. Three chapters outline the morphology, physiology, and reproduction. The remaining 30 chapters survey chiefly the taxonomy of the Protozoa by means of illustrations, keys, literature references, etc. Differentiation is carried down to species in the case of some of the more important forms.—*L. L. Woodruff.*

17484. LACORTE, J. G. Influence du pH dans les colorations par la méthode de Giemsa. *Compt. Rend. Soc. Biol.* 98(17): 1579-1580. 1928.—Optimum pH for staining of trypanosomes is given as 7.4, time 1 hr.

17485. LEPȘI, I. Despre Protozoare din apele sărate ale României. [Protozoa from the salt waters of Rumania.] *Intâil Congr. Nat. Naturalist. Romînîs* 1: 246-269. 4 fig. 1928(1930).—Twenty-one rhizopods, 30 flagellates, and 76 ciliates have been recorded.

17486. LIEBUS, A. Neue Beiträge zur Kenntnis der Eozänfauna des Krappfeldes in Kärnten. *Jahrb. Geol. Bundesanstalt Wien.* 77(3/4): 333-392. 3 pl., 4 fig. 1927.—The fossils of the Eocene deposits of the Krappfeld in Carinthia, have been the subject of numerous investigations. The present is the first published account of the rich microfauna of the gastropod marl. The bulk of the fossils found were foraminifera together with some Ostracoda, echinoderm spines, otoliths of fish and poorly preserved, distorted Gastropoda and bivalves. One hundred and ninety species of foraminifera were identified including *Frondicularia* carinthiaca* (p. 359); *Bulimina imbricata* v. procera* (p. 368); *Vaginulina* eocaena* (p. 361); *Plectofrondicularia* quadrilatera* (p. 367); *Sagrina* conulus* (p. 369); *Dimorphina* kahleri* (p. 371); *Ellipsodimorphina* complanata* (p. 372); *E.* cylindrica* (p. 372). The resemblance to certain foraminifera of the Cretaceous was very striking. The otoliths included 3 probably belonging to ganoids: *Otolithus* (*Berycidarum* ?) carinthiacus* (p. 381); *O.* (*Ganoidarum*) obovatus* (p. 383); *O.* (*Ganoidarum*) dentatus* (p. 384); *O.* (*Ganoidarum*) ovatus* (p. 384); *O.* (*Percidarum* ?) guttaringensis* (p. 385).—*A. Liebus* (*transl. by H. Sandon*).

17487. LOMBART, H. Un trypanosome non pathogène trouvé chez "Graphiurus murinus" au Katanga. *Ann. Soc. Belge Méd. Tropic.* 11(2): 209-212. 2 fig. 1931.—*Trypanosoma* graphiuri* (p. 209) is reported in the blood of the rodent *G. murinus*, in Katanga. It differs from *Trypanosoma lewisi* in the absence of a long fine point at the posterior extremity and in the median location of the nucleus. Inoculation of a rat and a mouse with infected heart blood gave negative results.

17488. LUDWIG, WILHELM. Über die Empfindlichkeitsgrenzen des Plasmas der Protozoen. *X^e Congres Internation. de Zool. à Budapest 1927.* Part I. p. 583-590. 1929.—In order to determine the effectiveness of extremely dilute solutions, attempts were made to influence the division rate of *Paramecium* with solutions of heavy metals, especially with silver nitrate solutions of potency 1-49. Carefully controlled experiments were several times repeated under parallel conditions, though always in

different watch glasses. The first set of these experiments in almost all potencies except those that were fatal, gave an increase in division rate; but these results were undoubtedly due to other causes as they were not again found, normal division being found in all dilutions except in the fatal potencies. A repetition of Junker's experiments on *Paramecium* failed to confirm his results, but showed a similar absence of effect of the most dilute solutions. Silver nitrate kills *Paramecium* in a dilution of 2,000,000 mol. per liter. *Paramecium* reacted to solutions of 10^{-8} g./ccm. ($=5.10^{-8}$ mol./1) usually temporarily, and in strongly hypotonic media were killed by 10x weaker solutions, so that the concentrations corresponding to the limit of sensitivity lie between 10^{-8} and 10^{-7} mol. in the liter. The phenomena occurring at the death of *Paramecium* in solutions of 10^{-1} to 10^{-7} were analyzed. Ten % silver solution fixes the cell instantaneously and rigidly because the pellicle becomes at once permeable and sieve-like, and the strong solution penetrates to the inside and coagulates the cell contents. In weaker solutions the firmness of the pellicle is destroyed and the cell contents tend to round out before death. In the weakest potencies, the water intake is increased and the contractile vacuoles are no longer able to compensate for this increase. Thus the internal pressure increases, the pellicle liquefies in places, and the death of the cell follows as a result.—*M. L. Austin.*

17489. MANGIN, L. Sur quelques peches planctoniques des mers de Chine et du Japon. *Bull. Mus. Nation. Hist. Nat. Paris* 1928(5): 371-380. 7 fig. 1928.—Several lists of dinoflagellates taken in Japanese waters. *Peridinium occanicum* v. **inaequipes*** (p. 376); *P.* **longispinum*** (p. 376); *P.* **obtusum*** (p. 377); *P.* **exiguipes*** (p. 377); *P.* **obliquum*** (p. 378); *P.* **obtusipes*** (p. 379); the diatom, *Coscinodiscus* **cylindricus*** (p. 379).

17490. MILLS, SYLVIA M. The effect of the H-Ion concentration on protozoa, as demonstrated by the rate of food vacuole formation in Colpidium. *Jour. Exp. Biol.* 8(1): 17-30. 1931.—The effect of the pH of the medium was determined quantitatively by counting the average number of food vacuoles formed per unit time when *Colpidium* was supplied with India ink. The rate of feeding was plotted against the pH of the medium; the curve rises steadily from pH 4.5 to a maximum at pH 6.0 and then falls gradually through the alkaline range; there is, in addition, a characteristic depression at pH 7.5-8.5. Methods for measuring the rate of movement of ciliates are described. The effect of changes in the pH of the medium on the movement of *Colpidium* corresponded very closely to the effect on the rate of food ingestion. It is suggested that changes in the rate of ciliary movement are largely responsible for changes in the rate of food ingestion. Mucus is shown to have a maximum viscosity at pH 8.0. It is suggested that the depression in the region of pH 8.0 seen in curves representing changes in the rate of feeding and movement with pH, indicate that the viscosity of the fluid in which the cilia are beating is one of the limiting factors in the rate of food ingestion.—*J. M. Robson.*

17491. PAULSEN, OVE. Études sur le microplancton de la mer d'Alboran. *Trab. Inst. Español Oceanogr.* No. 4. 1-108. 61 fig. 1930.—Plankton collections from the Mediterranean in the vicinity of Malaga are discussed. Bacillariales: 67 spp. are considered; *Thalassiosira* **hispanica*** (p. 7); *Schroederella schroederi** (Bergon) is distinct from *S. delicatula; Bacteriastrum hyalinum*; Chaetoceras rostratus*; C. convexicornis*; C. lorenzianus*; C. teres*; C. lauderi*; C. laciniosus*; C.* **diadema*** (*Syndendrium d.* Ehrenberg = *C. paradoxum* Cleve = *C. clevei* Schütt.) (p. 21); *C. wighami*; C. curvisetus*; C. pseudocurvisetus*; C. costatus**. Peridiniales: Prorocentraceae, 5 spp. are considered. Dinophysiaceae: 15 spp. are considered; *Phalacroma rotundatum*; Dinophysis sacculus*; D. caudata* v. *abbreviata**. Peridiniaceae: 86 spp. are considered; *Ceratocorys armata*; C.* **kofoidi*** (p. 36); *C.* **gourreti*** (p. 36); *Goniodoma sphaericum*; Goniaulax* sp.*; Spiraulax jolliffei*; Diplopsalis asymmetrica* (Mangin) (= *Diplopelta bomba* (Stein)). The genus *Peridinium* is divided into 2 subgenera. Subgenus *Archaeperidinium* contains section **AVELLANA** (p. 43), based on *P.* **abei** (p. 53), n. n. for *P. biconicum* Abé, *P. avellana, P. levanderi, P. minutum, P. quinquecorne* (?), *P. thorianum,* and *P. ventricum;* and section **EXCENTRICA** (p. 54), based on *P. excentricum* and *P. grenlandicum.* Subgenus **VEROPERIDINIUM** (p. 54) contains sections *Pellucida, Humilia, Piriformia, Tabulata, Divergentia, Oceanica, Conica,* and **PARADIVERGENTIA** (p. 55), based on *P. areolatum, P. spinosum,* and *P. solidicorne. P.* (*A.*) **schilleri*** (p. 56) belongs to section *Pellucida,* near *P. pallidum**. *P. diabolus**. *P.* **simulum*** (p. 58), n. n. for *P. globulus* Broch is in section *Humilia. P. globulus*; P. quarnerense*; P. mite*; P. oviforme*; P. longicollum*; P. crassipes*; P. oceanicum*; P. claudicans*; P. grande*; P.* **marielebourae*** (p. 69) n. n. for *P. obtusum* Fauré-Fremiet, is in section *Conica. P. leonis*; P. subinerme*; P. punctulatum*; P. biconicum** Dangeard; *Ceratium praelongum*; C. furca*; C. tripos*; C. pulchellum*; C. symmetricum*; C. declinatum* v. *majus*; C. concilians*; C. karstenii*; C. ranipes*; C. macroceros*; C. massiliense*; C. protuberans*; C. carriense*; C. contrarium*; C. horridum*; C.* **tenuissimum*** (*C. horridum buceros* f. *tenuissimum* (Kof.)) (p. 93); *C.* **denticulatum*** (*C. horridum buceros* v. *denticulatum* Jörgensen) (p. 93). In addition the material collected included 1 Silicoflagellata, 1 Flagellata, 1 Chlorophyceae, 14 Tintinnidae. The bibliography contains 141 references.

17492. PETERS, FRITZ. Eine einfache Methode zur Betäubung von Rädertieren, Paramaecien usw. in ausgestrecktem Zustande. *Zool. Anz.* 87(1/2): 18-20. 1930.—The use of vapor of pyroligneous acid for narcotizing various microorganisms without killing or permanently injuring them, is described. The method is said to be rapid and easy to use; the acid is merely brought into the immediate vicinity of the water containing the organisms. The author gives a table showing exposure times and duration of narcotization for different rotifers. *Paramecium, Stylonychia,* and *Volvox* were narcotized with like results.—*G. H. Ball.*

17494. PINTO, CESAR. Classification des Sporozoaires de la sous-classe Eimeridia. *Compt. Rend. Soc. Biol.* 98(17): 1571-1573. 1928.—A revision of the classification of Léger (1911) in which the order Coccidiomorpha Dof. is raised to a subclass and renamed **EIMERIDIA** (p. 1571) to contain 2 orders. The suborder Coccidiida Labbé is raised to an order and renamed **EIMERIIDA** (p. 1571); containing one superfamily **EIMERIOIDEA** (p. 1572), and 11 families: Eimeriidae, containing *Eimeria, Bananella, Crystallospora, Jarrina,* and *Mitrocystis;* Isosporidae [claimed as new, but already proposed by Minchin in 1903] for *Isospora* A. Schn. (= *Diplospora* Labbé); Caryosporidae containing only *Caryospora;* **BARROUSSIIDAE** (p. 1572), containing *Barroussia, Echinospora, Urobarrouxia,* and *Merocystis;* Caryotrophidae, containing only *Caryotropha;* **MYRIOSPORIDAE** (p. 1572), based on *Myriospora;* Angeiocystidae, containing only *Angeiocystis;* Cryptosporidiidae, containing only *Cryptosporidium;* Cyclosporidae, containing only *Cyclospora;* **PFEIFFERINELLIDAE** (p. 1572), containing only *Pfeifferinella;* and Aggregatidae containing only *Aggregata.* Order Adeleida contains one superfamily **ADELEOIDEA** (p. 1572) and 6 families: Adeleidae containing *Adelea* and *Adelina;* **KLOSSIIDAE,** containing *Klossia, Orcheobius,* and *Cariniella;* **CHAGASELLIDAE** (p. 1573), based on *Chagasella;* Klossiellidae, containing *Klossiella;* Dobellidae, containing only *Dobellia;* and Legerellidae,

containing only *Legerella*. *Diaspora* Léger, *Pseudoklossia* Léger and *Selysina* Duboscq are not placed.

17495. **PRINGSHEIM, E. G. Untersuchungen an Paramaecium bursaria über die Symbiosefrage.** *Congrès Internation. Xe Zool. à Budapest 1927*. Part 2. pp. 906-907. 1929.—*Paramecium bursaria*, if it contains zoochlorellae, maintains itself and even multiplies in medium containing no formed food. In very crowded cultures, in the light, oxygen used by paramecium is derived from the symbionts. The value of the relation to the algae is uncertain, but it has not been possible to cultivate them separately from the paramecia, whereas the latter can be cultivated alone.—*G. Alexander.*

17496. **RAY, HARENDRA NATH. Studies on some Sporozoa in polychaete worms. 1. Gregarines of the genus Selenidium.** *Parasitology* 22(3): 370-396. 4 pl., 3 fig. 1930.—Results are given of detailed studies of the parasites found at Plymouth, England. The main facts in Brasil's (1907) account of the intracellular schizogony in *Selenidium caullery*i* from *Protula tubularia* are confirmed. Intracellular schizogony is described in *S. mesnili* Brasil from *Myxicola infundibulum*, and early stages in sporogony of this and the preceding species are described for the first time. The life histories of Caullery and Mesnil's 2 unnamed spp. of *Selenidium* (*S. spionis* (Koll.) and *S.* foliatum (p. 382)) were exhaustively studied. No schizogonic phase was seen in either. The gametocysts, described for the first time, develop fully only after escape into the sea. The gametocysts of *S. spionis* are ovoid, 108$\mu \times 60\mu$, and contain spores with 4 sporozoites; those of *S. foliatum* are spherical, 70μ in diam., and their spores contain 8 sporozoites. Precocious association is observed in *S. foliatum:* The 2 associates are of very different sizes; the larger is 230-250$\mu \times$ 40-50μ, the smaller 40-50$\mu \times$15-30μ, and when stained intra vitam with neutral red, the cytoplasm of the shorter of the 2 behaves differently from that of the longer and shows innumerable pink granules. New or hitherto little known spp. of *Selenidium* are recorded, including: *S.* plicatum* (p. 387), in *Cirratulus cirratus; S.* branchiommatis* (p. 388) and *S.* alleni* (p. 388), in *Branchiomma vesiculosum; S.* brasili* (p. 390), from intestine of *Pomatoceros triqueter; S. sabellae*, from the digestive tube of *Sabella pavonina; S. terebellae* from the gut of *Terebella lapidoria*. A discussion of the value of the diagnostic characters of the genus follows. It is suggested that *Selenidium* requires drastic revision and will probably have to be dismembered. The occurrence of characteristic chromatin bodies in the posterior end of all gregarines examined, is stressed; these bodies have apparently hitherto escaped the attention of most students.—*H. N. Ray.*

17497. **RAY, HARENDRA NATH. Studies on some Sporozoa in polychaete worms. II. Dorisiella scolelepidis, n. gen., n. sp.** *Parasitology* 22(4): 471-480. 2 pl., 1930.—The organism dealt with here is the first gut-inhabiting organism remotely resembling Coccidia that has ever been described in detail from an annelid worm. The chief characters are: Chromatic granules present at the anterior end at all stages; 2 types of schizogony, with merozoites arranged "en barillet"; the macrogametocytes are migratory; no oocyst is developed round the zygote; two spores are formed, each containing 8 sporozoites. **DORISIELLA,** type *D.* **scolelepidis*** (p. 478), in the epithelial cells of the gut of *Scolelepis fuliginosa* Clpde.—*H. N. Ray.*

17498. **ROSKIN, GR. Neue Flagellatenarten.** *Arch. Protistenk.* 73(2): 203-205. 5 fig. 1931.—*Acinetactis* **polymorpha*** (p. 203); *Anisonema* **obliquum*** (p. 203); *Urceolus* **ovatus*** (p. 204); *Actinomonas* **radiosa*** (p. 204); *Codonosiga* **ornata*** (p. 205); all from the Moscow region.—*L. E. Noland.*

17499. **SILVESTRI, A. Nummuliti, Operculina e Planorbullina di Derna nella Cirenaica.** *Mem. Pont. Accad. Sci. Nuovi Lincei Ser.* 2. 11: 263-278. 1 pl., 3 fig. 1928.—Describes and pictures the following Eocene (Lutetian) foraminifera: *Nummulites atacica*, N. laevigata*, *Operculina pyramidum*, *Planorbulina nodosa**. Bibliography.—*F. Anderegg.*

17500. **VALKANOV, A. Beitrag zur Morphologie und Karyologie der Microcometes paludosa Cienk.** *Arch. Protistenk.* 73(3): 367-370. 5 fig. 1931.—Cases formed by *M. paludosa* are homaxial when formed free from the substrate, monaxial when formed against the coverglass. There is no chromidial ring and the nucleus is central. The nucleolus disappears completely at cell division. The chromosomes arise on the net-knots of the outer part of the nucleus. Figures of metaphase and anaphase are given. Comparison is made with the closely related Microgromia.—*L. E. Noland.*

17501. **VAUGHAN, THOMAS WAYLAND. New species of Operculina and Discocyclina from the Ocala limestone.** *Florida Geol. Survey Ann. Rep.* 1926-1927: 155-162. 2 pl. 1928.—Discusses specific and varietal nomenclature, and lists and describes the following large foraminifera from the Eogene Ocala limestone of Florida and Georgia: *Operculina* **mariannensis*** (p. 158), *Discocyclina* (*Discocyclina*) **citrensis*** (p. 159), *D. bainbridgiensis**, and *Asterocyclina* **chipolensis*** (p. 161).—Bibliography.—*F. Anderegg.*

17502. **VAUGHAN, THOMAS WAYLAND. Descriptions of new species of Foraminifera of the genus Discocyclina from the Eocene of Mexico.** *Proc. U. S. Nation. Mus.* 76(3): 1-18. 7 pl. 1929.—Nine species and varieties referred to the genus *Discocyclina* are described and figured. A key to the various species is given as well as a review of numerous other species described from America. These species do not include the Mexican forms which belong to the subgenus *Asterocyclina* Gümbel. Types in Nat. Mus. *Discocyclina* **weaveri*** (p. 6), Chicontepec formation; *D.* **perpusilla*** (p. 9), Guayabal formation; *D.* **cushmani*** (p. 11); *D.* **zaragosensis*** (p. 13); *D.* **cloptoni*** (p. 14), Tepetate formation; *D.* **stephensoni*** (p. 16); *D.* **palenquensis*** (p. 17); *D. weaveri* v. **parvipapillata*** (p. 7), Chicontepec formation.—*J. A. Cushman.*

17503. **VLERK, I. M. van der. The genus Lepidocyclina in the Far East.** *Eclogae Geol. Helvetiae* 21(1): 182-211. 18 pl. 1928.—The subgenera of *Lepidocyclina* are discussed, including the new subg. **TRYBLIOLEPIDINA** (p. 183), type *L.* (*T.*) **orientalis** (*Lepidocyclina munieri* v. *o.*). Keys are given to the subgenera, and to the 50 species described and figured including *L.* (*Isolepidina*) **boetonensis*** (p. 191), E. Indies, Eocene. This species is the only *Isolepidina* known from the region. Three tables list in detail the various characters of the species.—*W. Berry.*

17504. **WEINECK, ERWIN. Die chemische Natur der Skelettsubstanzen bei den Ophryoscoleciden.** *Jenaische Zeitschr. Naturwiss.* 65(3): 739-751. 1 pl. 1931.—The outer skeleton, the pellicula, is of silicic acid, in the form of silica gel. The inner skeleton of plates is chemically complex. The alveolar walls are of a fairly resistant carbohydrate, apparently of the cellulose group. The alveolar content is of a less resistant carbohydrate, identified as the substance described as paraglycogen by Bütschli from the entoplasma of *Clepsidrina blattarum*. It is a nutritive material.—*Author's summary* (*transl.*).

17505. **WHITE, M. P. Some index Foraminifera of the Tampico Embayment area of Mexico.** *Jour. Paleontol.* 2(3 and 4): 177-215, 3 pl., 1 fig.; 280-317, 5 pl. 1928; 3(1): 30-58. 2 pls. 1929.—The Tampico Embayment area comprises the portion of the Gulf Coastal Plain extending from the Tamaulipas Mts. to a short distance south of the Panuco River. There is a warm belt of Tertiary sediments along the coast but the remainder is made up of Cretaceous sediments. Foraminifera are abundant and there are practically no other fossils. As the northern oil fields of Mexico are in this region the Foraminifera are of great importance as a means of correlation especially as outcrops are scarce and lithologic distinctions difficult to make. The Up. Cretaceous formations include the Velasco, the Mendez, the Papagallos, and the San Felipe in descending order. These

overlie the Tamaulipas limestone of the Lr. Cretaceous, from which most of the petroleum is derived. Several hundred species occur in the Up. Cretaceous formations but of these only 143 are included in the present study. Types of new species are in the Paleontological Coll. Columbia Univ. *Psammosphaera* **laevigata*** (p. 183); *Kalamopsis* **dubia*** (p. 185); *Globigerina* **angulata*** (p. 191); *G.* **belli*** (p. 192), Mendez formation; *G.* **mckannai*** (p. 194); *G.* **pseudotriloba*** (p. 194); *G.* **quadrata*** (p. 195), Mendez; *G.* **triangularis*** (p. 195); *G. velascoensis* v. **compressa*** (p. 196); *G.* **voluta*** (p. 197), Mendez; *Lenticulina* **velascoensis*** (p. 199); *Astacolus* **velascoensis*** (p. 202); *Frondicularia* **elongata*** (p. 205), Mendez; *Lagena aspera* v. **apiculata*** (p. 208); *Oolina simplex* v. **lacrima*** (p. 211); *Polymorphina* **mendezensis*** (p. 213); *Globotruncana canaliculata* v. **ventricosa*** (p. 284), Papagallos formation; *G.* **conica*** (p. 285) and *G. c.* var. **plicata*** (p. 285), Mendez; *Rotalia* **beccariiformis*** (p. 287); *R.* **cacalilaoensis*** (p. 288); *Gyroidina* **anomalinoides*** (p. 291); *G.* **beisseli*** (p. 291), Mendez; *G.* **comma*** (p. 292); *G.* **florealis*** (p. 293); *G.* **mendezensis*** (p. 293) and *G.* **minuta*** (p. 294), Mendez; *G.* **naranjoensis*** (p. 296); *G.* **simplex*** (p. 296) and *G.* **sparksi*** (p. 297), Mendez; *G.* **vortex*** (p. 297); *Cibicides* **naranjoensis*** (p. 298); *C.* **risseri*** (p. 298); *Planulina* **dayi*** (p. 300), Mendez; *Baculogypsina* (?) **gallowayi*** (p. 305); *B.* (?) **lenticulata*** (p. 306) and *B.* (?) **sphaerica*** (p. 306), San Felipe formation; *Trochamminoides* **irregularis*** (p. 307); *Verneuilina* **conica*** (p. 310); *V.* **rotunda*** (p. 310) and *Textularia* **nacataensis*** (p. 31), Mendez; *T. n.* var. **cyclostoma*** (p. 31); *Gümbelina* **ultimatumida*** (p. 39), *Pseudotextularia varians* v. **mendezensis*** (p. 41) and *P. v.* var. **textulariformis*** (p. 41), Mendez; *Bolivina* **primatumida*** (p. 44); *Bifarina* **nodosaria*** (p. 45); *Bulimina* **limbata*** (p. 48), *B.* **mendezensis*** (p. 49) and *Pleurostomella subnodosa* v. **gigantia*** (p. 53), Mendez; *Nodosarella* **striata*** (p. 54); *Pullenia* **coryelli*** (p. 56). Except where otherwise given, new forms are from the Velasco formation.—*J. A. Cushman.*

17506. WOODRING, W. P. Upper Eocene orbitoid Foraminifera from the western Santa Ynez Range, California, and their stratigraphic significance. *Trans. San Diego Soc. Nat. Hist.* 6(4): 145-170. 5 pl. 1930.—The limestone from a locality on the west side of Canada de Los Sauces on the South slope of the western Santa Ynez, about 2 miles Northwest of Sudden, contains well preserved specimens of *Discocyclina*. This limestone rests disconformably on a massive sandstone. The maximum thickness of this lens of limestone is 8 ft., the lower half consisting of a hard limestone made up principally of calcareous Algae, while the upper part is soft and marly with great numbers of foraminifera and few other organisms. The only other California locality where stellate orbitoids have been found is in the San Rafael Mts. *Discocyclina* **psila*** (p. 148); *Actinocyclina* **aster*** (p. 152); types in California Inst. Technology. In America these 2 genera have only been found in the Eocene. While the genus *Discocyclina* occurs in the Lower, Middle, and Upper Eocene, *Actinocyclina* in the eastern U. S. A. is recorded only from the Up. Eocene in the Ocala limestone of Florida, Georgia, and Alabama. It is also widespread in the West Indies, Central Amer., and northern S. America. In Europe it is also found in the Middle Eocene. From the American occurrences of *Actinocyclina* these beds of the West coast are evidently of Up. Eocene age. A number of pages of notes give the basis for correlation of these deposits with other West coast areas as well as those of greater distance.—*J. A. Cushman.*

17507. ARNDT, WALTHER. Die Süsswasserschwämme des arktischen Gebietes. *Fauna Arctica* 6(1): 33-40. Gustav Fischer: Jena, 1931.—A list of 5 forms of *Spongilla* and *Ephydatia* with key.

17508. ARNDT, WALTHER. Unbekanntes von den Meeresschwämmen der deutschen Küsten. *Mikroskopie f. Naturfreunde* 7(5): 129-138. 8 fig.; (6): 161-170. 3 fig.; (7): 201-207. 1929.—Present information as to taxonomy, morphology and physiology of German sponges is reviewed in some detail. Much data is still lacking; for example, scarcely half the species probably occurring in German waters have yet been recorded, for most, the embryology and life history are not known, their diets and nutritions are not understood, and little is known about their diseases.—*M. W. de Laubenfels.*

17509. BRÖNDSTED, H. V. Die Kalkschwämme der Deutschen Südpolar-Expedition 1901-1903. *Drygalski's Deutsche Südpolar-Exped. 1901-1903 Zool.* 20(12): 1-47. 36 fig. W. de Gruyter & Co.: Berlin & Leipzig, 1931.—Of 52 spp. of Calcarea found in the Antarctic regions, 38 are peculiar to the region. The present report deals with 37 spp., many of which are illustrated. *Leucosolenia primordialis* v. **apicalis*** (p. 9); *L.* **hispida*** (p. 12); *L.* **aboralis*** (p. 15); *L.* **australis*** (p. 15); *L.* **solida*** (p. 17); *L.* **pilosella*** (p. 17); *Leucetta isoraphis* v. **apicalis** (p. 21); *L.* **gaussii*** (p. 21); *Sycetta* **antarctica*** (p. 23); *Tenthrenodes* **primitivus*** (p. 24); *Grantia* **transgrediens*** (p. 28); *G.* **vitiosa*** (p. 29); **JENKINA** (p. 32) (Grantiidae), near *Leucandra*, based on *J.* **cirrata** (*L. c.* Jenkin) (p. 33); *J.* **hiberna** (*L. h.* Jenkin) (p. 34); *J.* **articulata*** (p. 34); *J.* **glabra*** (p. 37); *Leucandra* **hentschelii*** (p. 40); *L.* **gausapata*** (p. 42); *L.* **comata*** (p. 43).

17510. BURTON, MAURICE. Additions to the sponge fauna of the Gulf of Manaar. *Ann. and Mag. Nat. Hist.* 5(30): 665-676. 3 fig. 1930.—A small collection of sponges presented to the British Mus. by the late Arthur Dendy included the following new spp.: *Chalina* **tenuiramosa** (p. 666); *Cladochalina* **thurstoni*** (p. 667); *Laxosuberites* **conulosus** (p. 669); **TERPIOSELLA** (p. 675), type *Ophlitaspongia fucoides* Bowerb., **LAXOSUBERELLA** (p. 675) (*Suberella* Burton). A revision of the genera of Polymastidae and Suberitidae is included.—*M. W. de Laubenfels.*

17511. TOPSENT, E. Phénomènes de styloprothèse chez des Poecilosclérines. *Arch. Zool. Exp. et Gén. Notes et Rev.* 68(1): 19-32. 14 fig. 1929.—Certain Poecilosclerine sponges can utilize projecting parts of the substratum to replace the normal vertical columns of megascleres of their own skeleton which also undergoes some other changes. Such skeletal changes are termed styloprothesis, and were observed in the Acarnidae and Clathriidae. Thus a specimen of *Acarnus tortilis* Topsent growing on *Geodia cydonium* had used the oxeas of the latter in place of its own vertical columns of styles. *Alcyonium opuntioides* Lamarck, *Spongia frondifera* Lam., and *Hymeniacidon cliftoni* Bowerb. are all believed to be individuals of one sp. modified by growth on algae. Examination of Lamarck's specimens shows the sponge to belong to a new genus of the Clathriidae, *Anomoclathria* (p. 21), type *A.* **opuntioides*** (*Alcyonium o.* Lamarck) (p. 25), which is fully diagnosed; also *Anomoclathria opuntioides* **fondifera*** (*Spongia f.* Lamarck) (p. 27). In the specimen of *A. opuntioides* growing on an alga, the normal framework of spongin fibers inclosing styles is replaced in areas by the algal filaments and the acanthostyles which normally project from the spongin columns are modified into acanthostrongyles. Such phenomena are probably common in sponges and illustrate the unreliability of the monactinal or diactinal form of spicules as a taxonomic character.—*L. H. Hyman.*

Mededeel.* [*Leiden*] 13(1/2): 22-52. 6 pl. 1930.—A review of the material in the collection, consisting of 16 spp. of Poritidae, 2 of Favositidae, and 23 of Acroporidae. The following are figured: *Porites levis; P. lanuginosa; P. mordax; Goniopora planulata; Alveopora reteporu; A. allingi; Montipora complanata; M. levis* v. arborescens (p. 39), Indian Ocean, type in Leiden Mus.; *M. spatula; M. hispida; M. informis; M. stellata; M. tuberosa;* and *M. crassifolia.*

17519. TEISSIER, GEORGES. Notes sur la faune marine de la région de Roscoff. I. Hydraires. Trachyméduses, Cirripèdes. *Trav. Stat. Biol. Roscoff* No. 8. 183-186. 1930.—Brief notes on life history and ecology of various spp. *Gonionemus murbachi* is new to France.

17520. TEISSIER, LISE, et GEORGES TEISSIER. Actinia fragacea Gosse est-elle une simple variété d'Actinia equina? *Trav. Stat. Biol. Roscoff* No. 8 190-192. 1930.—The writer holds that *A. fragacea* is distinct from *A. equina* on the basis of reproduction, the former being oviparous, the latter, viviparous; and also on the basis of habits, color, and morphological characters.

17521. THOMSON, J. ARTHUR, and NITA RENNET. Alcyonaria, Madreporaria, and Antipatharia. *Australasian Antarctic Exped. 1911-14, Sci. Repts. Ser. C. Zool. & Bot.* [*Sydney*] 9(3): 1-46. 7 pl. (2 col.). 1931.—This report deals with 31 Alcyonaria, 5 Madreporaria, and 2 Antipatharia. The geographic records mentioned below are new. *Clavularia cylindrica,* descriptive notes, Adelie Land; *C. rosea,* descriptive notes, Macquarie Isl.; *Alcyonium antarcticum**, descr. notes, Adelie Land; *Eunephthya racemosa**, not previously recorded from Antarctic; *Melitodes rugosa,* descr. notes, Tasmania; descriptive notes for *Primnoisis ambigua, P. antarctica, P. armata, P. fragilis, P. sparsa,* and *Ceratoisis delicatula**, Tasmania; ECHINISIS (p. 15), near *Peltastisis* [Isididae, Mopseinae], based on *E.* armata* (p. 15) (*Primnoisis a.* Kük.); *Mopsea* tenuis (p. 16), Tasmania; new distribution and descriptive notes for *Callozostron horridum, Primnoella antarctica, P. australasiae, P. distans,* and *Caligorgia ramosa,* Tasmania; *C. ventilabrum;* ASCOLEPIS (p. 20), near *Caligorgia,* based on *A.* splendens* (p. 20), Adelie Land, and *A.* spinosa* (p. 22), Antarctic; descriptive notes for *Thouarella longispinosa**, *T. striata,* and *T. variabilis**, Adelie Land; *Dicholaphis* delicatula* (p. 30), off Macquarie Isl.; *Astromuricea* formosa* (p. 31), locality unknown; *Leptogorgia sarmentosa,* descr. notes; *Scleroptilum* does not belong to the Kophobelemnonidae, but is close to *Chunella; S. grandiflorum,* new to Antarctic; descriptive notes for *Umbellula carpenteri**. The position of *Ainigmaptilon* and its type *A. hasselli** is discussed; *Caryophyllia clavus* and *C. inskipi**, descr. notes, near Antarctic; *C. vermiformis* and *Flabellum australe,* descr. notes near Tasmania; *F. transversale,* descr. notes, Antarctic; *Bathypathes patula,* Antarctic; *Euantipathes plana,* off Macquarie Isl. Depth records are given for all spp. collected.

PLATYHELMINTHES AND MESOZOA

H. W. STUNKARD, *Editor*

(See also in this issue Entries 16569, 16572, 16573, 16574, 16589, 16592, 16609, 16610, 16618, 16638, 16640, 16641, 17464, 18112, 18114)

17522. ÁBRAHÁM, AMBROSIUS, und GUSTAV MÖDLINGER. Die Planarien des Mátra-Gebirges. *Zool. Anz.* 90(3/4): 121-127. 1 fig. 1930.—*Planaria alpina* and *P. gonocephala* are 2 spp. found in springs and creeks. Egg cocoons of *P. alpina* were found in September, contrary to general opinion that they reproduce in winter only. In the springs of the higher peaks (926 m.) white specimens of *P. alpina* are common. In the springs of the highest peak of Kékesberg (1014 m.) no planarians are found. In the higher and colder springs *P. alpina* dominates, in lower and warmer springs, *P. gonocephala.* There were no intermediate *Polycelis cornuta,* as in Higher Tatra mountains. Approximate extremes of temperature for *P. alpina* are 6° and 13.5° C. and for *P. gonocephala,* 11° and 17.5° C. The vertical limits for *P. alpina* are 452-958 m. and for *P. gonocephala,* 325-785 m. *P. alpina* cannot be considered as fauna relicta.—*P. B. Šivickis.*

17523. AFRICA, CANDIDO M. The excretory system of Cercariaeum lintoni Miller 1926. *Jour. Parasitol.* 17 (1): 14-17. 2 fig. 1930.—The excretory system is described as consisting of 16 flame cells distributed in the pattern 2[(2+2)+(2+2)]. On each side, the anterior and posterior primary collecting tubes unite just posterior to the ventral sucker to form the common collecting tube which empties into the bladder. Rhythmic contraction and relaxation of the bladder took place at irregular intervals varying from 10 to 30 seconds. The mechanism by which it is emptied is described.—*O. R. McCoy.*

17524. BRESSLAU, ERNST, und ERICH REISINGER. Erster Cladus der Vermes Amera. Plathelminthes. In: *Kükenthal's Handbuch der Zoologie* 2 (No. 1, pt. 1): 34-51. 9 fig. 1928.—The writers divide the Plathelminthes into 2 subdivisions, Euplathelminthes and Rhynchocoela. The former contains the classes Turbellaria, Trematodes, and Cestodes. The Rhynchocoela contains only the class Nemertini. The article describes the general morphology, anatomy, and phylogeny of the group.

17525. FUHRMANN, OTTO. Zweite Klasse des Cladus Plathelminthes, Trematoda. In: *Kükenthal's Handbuch der Zoologie* 2 (No. 3, pt. 2): 1-128. 171 fig. 1928; (No. 7, pt. 2): 129-140. 4 fig. 1930.—A general morphological description of the Trematoda opens the treatment. Each order (Monogena and Digenea) is characterized and its morphology, anatomy, and taxonomy treated, with particular attention to the nervous, alimentary, excretory, and lymphatic systems, the sexual organs, embryology, life stages, host relations, phylogeny, etc. In the systematic treatment all groups are defined and the genera listed. Among the suborders of Monogena is recognized **MONOPISTHODISCINEA** (p. 26), containing the families Protogyrodactylidae, Gyrodactylidae, and Calceostomidae.

17526. FUHRMANN, OTTO. Dritte Klasse des Cladus Plathelminthes, Cestoidea. Erste Unterklasse der Cestoidea, Cestodaria Monticelli. 1. Ordnung der Unterklasse Cestodaria: Amphilinidea Poche. 2. Ordnung der Unterklasse Cestodaria: Gyrocotylidea. Zweite Unterklasse der Cestoidea, Cestoda. 1. Ordnung der Unterklasse Cestoda: Tetraphyllidea. 2. Ordnung der Unterklasse Diphyllidea. 3. Ordnung der Unterklasse der Cestoda: Tetrarhynchidea. 4. Ordnung der Unterklasse der Cestoda: Pseudophyllidea. 5. Ordnung der Unterklasse der Cestoda: Cyclophyllidea. In: *Kükenthal's Handbuch der Zoologie* 2 (No. 7, pt. 2): 141-256. 110 fig. 1930; (No. 11, pt. 2): 257-416. 150 fig. 1931.—The treatment of the Cestoidea is given in sections dealing with each subclass and order. The class is divided into subclasses Cestodaria and Cestoda. Orders and families are given, and in some cases, subfamilies, and the genera are listed. Each group is defined, its general morphology, anatomy, classification, and phylogeny discussed, and detailed comparative treatment given in most cases of the excretory, reproductive, and nervous systems, the life stages, sense organs, skin, musculature, etc. In the subclass Cestoda of the Cestoidea, the family Carophyllaeidae contains a new subfamily, **BOVIENINAE** (p. 332), with the genus **BOVIENIA** (p. 332), based on *B.* **serialis** (p. 309), n. comb., from *Clarias batrachus.* The bibliography contains 123 references.

17527. KOBAYASHI, HIDEKAZU. Studies on the development of Diphyllobothrium mansoni Cobbold 1882 (Joyeux, 1927). IV. Hatching of the egg, onchosphaera and discarding of the ciliated coat. V. On the first intermediate host, and development in the first intermediate host. *Taiwan Igakki Zasshi (Jour. Med. Assoc. Formosa)* **30**(2) (no. 311, Feb.): 15-16; (3): (No. 312, Mar.) 24-27. 1931.—IV. Hatching depends on both internal and external factors, including internal tension, tonicity of the medium, absence of fermentive agents, optimum temperature (26-35° C.) and mechanical agitation of the medium. Upon hatching, the ciliated embryo rises to a few mm. of the surface and swims about for 23 hrs. (the infective period). The swimming movement consists of free gliding, counter-clockwise rolling, and turn-table movements. During this period no galvanotaxis is detectable but phototaxis is appreciable. Shedding of the ciliated epithelial membrane is accomplished by injury to the inner side, due to rapid movement of the 3 pairs of hooks, and penetration outward through this injury.—V. The onchosphere developed to maturity in spp. of *Cyclops,* any of the 9 spp. of which, in the vicinity of Taihoku City, serve this purpose. The larvae when swallowed by the *Cyclops* make their way through the intestinal wall to the body cavity. Notable differences were experienced in the susceptibility to invasion from the larvae, ♂♂ being much more susceptible than ♀♀. Old *Cyclops* were not more resistant than young ones. On the whole *C. leuckarti* was the more successful experimental host.—*E. C. Faust.*

17528. MacCALLUM, G. A. Four new species of trematode worms of the subfamily Onchocotylinae. *Proc. U. S. Nation. Mus.* 79(26): 1-8. 1 pl., 1 fig. 1931.—*Acanthonchocotyle* **musteli*** (p. 2), from gills of *Mustelus canis; Squalonchocotyle* **squali*** (p. 3) and *S.* **acanthi*** (p. 5), on gills of spiny dogfish, *Squalis acanthias; S.* **sphyrnae*** (p. 6), from gills of hammerhead shark, *Sphyrna zygaena; S. vulgaris** was found on the gills of the dusky shark, *Carcharinus milberti; S. canis** was found on gills of *Carcharinus limbatus.* Localities not given.

17529. OLDHAM, J. N. On the arthropod intermediate hosts of Hymenolepis diminuta (Rudolphi 1819). *Jour. Helminthol.* 9(1): 21-28. 1931.—The larvae of the squirrel flea, *Ceratophyllus wickhami* Baker, were experimentally infected. The effect on the host was nil. A list, with critical comments, is given of the intermediate hosts of this cestode. It includes Myriopoda, Orthoptera, Dermaptera, Lepidoptera, Siphonaptera, and Coleoptera.—*F. J. Meggitt.*

17530. QUERNER, FRIEDRICH R. v. Zur Histologie des Exkretionsgefässsystems digenetischer Trematoden. I. Teil. *Zeitschr. Wiss. Biol. Abt. F, Zeitschr. Parasitenk.* 1(4/5): 489-561. 32 fig. 1929.—The excretory system of 6 trematodes is described showing 3 main types of arrangement based on the kind of terminal region. *Fasciola hepatica** and *Fasciola gigantica** show a dorsal and a ventral network arising from a median stem which divides in front of the shell gland into 2 anterior canals which split again dichotomously to form dorsal and ventral branches. Peripheral longitudinal canals, capillaries, and terminal organs are absent. No urinary bladder is recognized. *Dicrocoelium lanceatum** shows the typical trematode protonephridial system. Very large terminal organs, arranged in symmetrical groups with the formula, 2(1+2+2+2+2+1) have cortical cells. Secondary tubules are much reduced. A short, unpaired, non-muscular terminal region is not considered to be a urinary bladder. A strong sphincter guards the excretory pore. *Sterrhurus fusiformis** Lühe possesses a typical urinary bladder with strong musculature and a strong sphincter around the excretory pore. *Paryphostomum radiatum** Dietz shows a pair of lobed main vessels and an unpaired, weakly muscular terminal region considered by the author as a urinary bladder. A sphincter is lacking. Very small and numerous terminal organs, without cortical cells, have a non-nucleated cap and resemble the funnel-shaped cells of *Schistosomum haematobium. Aspidogaster conchicola** possesses 2 typical, strongly muscular urinary bladders and 2 separate excretory pores. The 3 types of excretory systems described by the author are, (1) those with muscular urinary bladder, (2) those with distended terminal region without musculature, and (3) those without any histologically differentiated terminal region. The author discusses the relationships of these types and proposes the use of the term "Harnreservoir" for a terminal region serving as a storage bladder but possessing no musculature.—*C. H. Willey.*

17531. SCHULZ, R. ED., und A. A. SKWORZOW. Plagiorchis arvicolae n. sp. aus der Wasserratte. *Zeitschr. Wiss. Biol. Abt. F, Zeitschr. Parasitenk.* 3(4): 765-774

3 fig. 1931.—**MULTIGLANDULARIS** (p. 771), subg. of *Plagiorchis*, type *P.* (*M.*) *multiglandularis* Semenov, also includes 18 other spp. (listed) of which one is new: *Plagiorchis* (*M.*) **arvicolae*** (p. 765), parasitic in the small intestine of the water rat, *Arvicola terrestris*, in U. S. S. R.

17532 SINITSIN, D. Studien über die Phylogenie der Trematoden. V. Revision of Harmostominae in the light of new facts from their morphology and life history. *Zeitschr. Wiss. Biol. Abt. F, Zeitschr. Parasitenk.* 3(4): 786-835. 6 pl., 5 fig. 1931.—[Trematoda. Digenea]. The general morphology of the Harmostomidae is described, with special attention to the Ectosiphorea* and Entosiphonea* types. As there are no free-living miracidia in the life history of Harmostominae, the eggs of each sp. stand an equal chance of being fed on by any snail that feeds on decaying organic matter, but the parthenitae seem able to develop only in a specific host. The writer suggests that parasitism by trematodes in the liver of snails was the primary cause of spiral torsion in the Gastropoda. At four geological periods Gastropoda arose with deficient or cap-shaped shells, indicating that preceding their appearance there happened something that rid their ancestors of parasites. This may have been the extinction of the primary hosts, large groups of vertebrates having perished before each period of molluscan cap-shaped shells. The cercariae of Harmostomidae have no tail, and pass their adolescence in the same snail in which they developed. The cercaria of *Telorchis robustus** [Telorchidae] from the liver of *Polygyra thyroides* is described. It has adhesive glands on the tail. Maritae of this sp. were found in the turtle, *Testudo carolina*. A cercaria of *Telorchis* sp.* (?) from the land snail, *Gastrodonta ligera*, has glandular cells in a vesicular portion at the base of the tail. These telorchid cercariae seem to represent phases in the evolution of the tail of cercariae resulting from absence of water. The cercariae of *Leucochloridia* do not leave the body of their mother, but in the Harmostominae they do. In order to get from the liver to the kidney, where the adolescariae usually live, the cercariae leave the body of the snail and enter the kidney cavity. Other adolescariae live in the pericardium or in the salivary glands. Harmostomidae, redefined, is divided into subfamilies Harmostominae and Leucochloridiinae. The former is divided into tribes. Tribe **ENTOSIPHONEA** (p. 817), including *Harmostomum migrans*, parthenita* from liver of *Polygyra thyroides*, cercaria* and adolescaria* from kidney of same host, Virginia, marita* from *Didelphys virginiana*, Maryland; **ENTOSIPHONUS** (p. 820), type *E.* **thompsoni*** (p. 821), parthenita* from liver of *Gastrodonta suppressa*, adolescaria* from kidney of same host, marita* from small intestine of *Blarina brevicauda*. Tribe **ECTOSIPHONEA** (p. 817), including: **ECTOSIPHONUS** (p. 822), based on *E.* **rhomboideus*** (p. 823), parthenita* from liver and walls of respiratory cavity of *Gastrodonta ligera*, cercaria* from kidney, and adolescaria* from kidney and salivary glands of same host, District of Columbia; and *E.* **ovatus** (p. 825), adolescaria* from kidney of *Gastrodonta suppressa*, Virginia, marita* from small intestine of *Blarina brevicauda;* **PANOPISTUS** (p. 826), in tribe Ectosiphonea, based on *P.* **magnus** (p. 827), parthenita* from liver, cercaria* from liver and pericardium, and adolescaria* from pericardium of *Gastrodonta ligera*, Dist. Columbia; *P.* **oviformis*** (p. 829), cercaria* from liver of *Helicodiscus parallelus*, Virginia; and *P.* **pricei*** (p. 829), adolescaria* from pericardium of *Gastrodonta suppressa*, D. C., marita* from small intestine of *Blarina brevicauda*, Virginia. All types in U. S. Nat. Mus. *Postharmostomum*, *Glaphyrostomum*, *Hasstilesia*, and *Urotocus* are placed in Ectosiphonea. *Scaphiostomum* and *Itygonimus* are placed in Ectosiphonea. The bibliography contains 47 references.

17533. STEINBÖCK, OTTO. Beiträge zur Kenntnis der Turbellarienfauna Grönlands. I. Bothrioplanida und Tricladida. *Meddel. om Grönland* 74(6): 71-82. 1928 (1930).—A survey of the limited turbellarian fauna of Greenland, with philosophical notes on its probable origin, and criticisms of contemporary studies.—*C. A. Hannum.*

17535. STUNKARD, H. W., and C. H. ALVEY. The morphology of Zalophotrema hepaticum, with a review of the trematode family Fasciolidae. *Parasitology* 22 (3): 326-333. 1 pl. 1930.—Detailed description of *Z. hepaticum** from the liver of a California sea-lion, *Zalophus californianus*. Genera assigned to families Fasciolopsidae and Campulidae may be included in a single family. As *Fasciola* is the nomenclatorial type of the family to which it belongs, by the rules of nomenclature the family Fasciolidae is restored, with three subfamilies, Fasciolinae, Fasciolopsinae, and **CAMPULINAE** (p. 332), n. subf. n. for Brachycladiinae, based on *Campula* Cob. A new genus, **SYNTHESIUM** (p. 332) (Campulinae), is erected for *Distomum tursionis* Marchi.—*E. T. Boardman.*

17536. STUNKARD, HORACE W. Further observations on the occurrence of anal openings in digenetic trematodes. *Zeitschr. Wiss. Biol. Abt. F, Zeitschr. Parasitenk.* 3(4): 713-725. 7 fig. 1931.—Recent investigations have shown that the intestinal caeca communicate with the exterior in a large number of digenetic trematodes. The connection may be by way of the excretory vesicle; there may be a single, separate opening, or there may be two anal pores. Such a connection has developed independently in several different families, but is not uniformly present in all members of those families in which it occurs. The writer considers that Ozaki was unjustified in removing *Coitocaecum* from Opecoelidae, and suggests that this group should be referred as Opecoelinae to Allocreadiidae. *Bianium plicitum**, redescribed; *Acanthochasmus* **diploporus*** (p. 722), in small intestine of *Alligator mississippiensis*, has two anal pores on each side of the excretory pore.

NEMATHELMINTHES AND NEMATOMORPHA

17538. CAMERON, THOMAS W. H. Observations on the life history of Aelurostrongylus abstrusus (Railliet), the lung worm of the cat. *Jour. Helminthol.* 5(2): 55-66. 2 fig. 1927.—This paper describes the larvae, their biology, and their transmission from cat to cat. The adults live in the lungs and lay eggs which hatch in situ. The resulting larvae have a characteristic undulating tail appendix and pass to the exterior in the droppings. They are unable to penetrate skin and must be swallowed by mice. In these they continue their development and come to be encysted in the connective tissue. When the mouse is eaten by a cat the larvae develop within 6 weeks into mature, egg-laying adults. Experiments, described in detail, show that direct transmission from cat to cat does not occur. It is suggested that the "cysts" observed by Leuckart in cats and attributed by him to *Ollulanus* (or to *Aelurostrongylus*) may be those of *Trichinella spiralis*, or, more probably,

Aelurostrongylus which had passed the pulmonary capillaries to other sites.—*T. W. H. Cameron.*

17546. **HARWOOD, P. D.** A new species of Oxysomatium (Nematoda) with some remarks on the genera Oxysomatium and Aplectana, and observations on the life history. *Jour. Parasitol.* 17(2): 61-73. 1 pl. 1930.—*Oxysomatium* variabilis* (p. 61), from *Bufo valliceps,* New York. Host list includes: *Triturus meridionalis, Ambystoma microstomum, Hyla squirella, Pseudacris triseriata, Rana areolata, R. palustris, R. sphenocephala, R. sylvatica, Gastrophryne areolata, Ophisaurus ventralis, Leiolopisma laterale, Heterodon contortrix, Storeria dekayi, Micrurus fulvius, Terrapene carolina* v. *triunguis,* and *T. ornata.* Locality records: Texas and New York. *Oxysomatium* Raill. & Henry (=*Aplectana* Raill. & Henry). Life history of *Oxysomatium* includes descriptions of the infective larva and the parasitic stages. Types in U. S. Nat. Mus.—*P. D. Harwood.*

17547. **HOBMAIER, ADELE, und MICHAEL HOBMAIER.** Ueber die Entwicklung des Lungenwurmes Synthetocaulus capillaris in Nackt-, Weg- und Schnirkelschnecken. *Münchener Tierärzt. Wochensch.* 80(36): 497-500. 4 fig. 1929.—The larva of *Synthetocaulus* undergoes no development until it enters a slug or snail host. In the following mollusks, *Agriolimax, Arion subfuscus, A. hortensis, A. circumscriptus, A. empiricorum, Fruticicola hispida, Monacha umbrosa, Cepaea hortensis, Helix pomatia, Cingulifera planospira,* and *Arianta arbustorum,* it undergoes two molts, becoming an infective third-stage larva with two sheaths over the third-stage cuticula. When snails containing infective larvae are swallowed by sheep the two sheaths are shed and the larvae undergo a development analogous to that described for *Metastrongylus,* maturing in the lungs.—*A. Hobmaier (transl. by C. A. Hannum).*

17548. **JOYEUX, CH., et J.-G. BAER.** Sur la présence du Nématode, Crassicauda crassicauda (Creplin, 1829) chez un Dauphin des côtes de la France. *Bull. Soc. Path. Exotique* 24(3): 198-203. 3 fig. 1931.—Fragments of the nematode *Crassicauda crassicauda,* found in the mammary gland of a dolphin, *Tursiops tursio* Fab., in the Gulf of Marseilles, included several ♀♀. Most of these specimens showed the deep constriction at the caudal end between vulva and anus, hitherto regarded as characteristic of the ♀. One ♀, however, presenting no trace of either eggs or spermatozoids in the uterus and therefore judged to be virgin, showed no trace of this constriction. Having observed that in copulation the ♂ wraps itself around the ♀ at this point, the authors conclude that the constriction is present only after copulation, and is the result of the pressure exerted by the ♂. The usual habitat of *C. crassicauda* is the urogenital connective tissue of cetaceans; but the mammary glands of the dolphin are near the vulva and therefore easily accessible to the parasite.

17549. **KREIS, HANS A.** Freilebende terrestrische Nematoden aus der Umgebung von Peking(China). *Zool. Anz.* 84(11/12): 283-294. 6 fig. 1929.—*Diplogaster* minor ♂* (p. 283); *Acrobeles* armatus ♀* (p. 285); *Rhabditis* elegans ♀* (p. 287); PSEUDORHABDITIS (p. 288), (Anguillulidae) near *Rhabditis,* based on *P.* labiatus ♀* (p. 288), and *P.* acuminatus ♀* (p. 290); *Tylenchus* browni* (p. 292).

17550. **MÜLLER, G. W.** Die systematische Stellung der Gordiaceen. *Zool. Anz.* 84(9/10): 241-243. 1929.—The author reviews recent works concerning the position of the Gordiacea, which have been separated from the Eunematoda because their gonads are said not to be continuous with their ducts. At certain earlier stages the writer finds that this difference does not exist. Therefore he concludes that the Gordiacea are morphologically not very different from the Nematoda.—*B. G. Chitwood.*

17551. **ORLOFF, I. W., und M. P. GNEDINA.** Ein neuer Nematode "Ostertagia dahurica nov. sp." aus dem Labmagen des Schafes. *Tierärztl. Rundschau* 37(41): 723-725. 5 fig. 1931.—*O.* dahurica* (p. 723), from fourth stomach of sheep, Dauria, Asiatic Russia.

17552. **SCHWARTZ, B., and J. E. ALICATA.** Two new species of nodular worms (Oesophagostomum) parasitic in the intestine of domestic swine. *Jour. Agric. Res.* 40(5): 517-522. 12 fig. 1930.—Detailed descriptions are given of two new nodular worms from the large intestine of domestic swine, *O.* brevicaudum* (p. 517) and *O.* georgianum* (p. 520), both taken at Moultrie, Georgia, the former in large numbers.—*W. A. Hooker (courtesy E. S. R.).*

17553. **SCHWARTZ, BENJAMIN, and JOSEPH E. ALICATA.** A Microfilaria from the blood of a wild rabbit. *Jour. Washington Acad. Sci.* 21(13): 298-301. 1 fig. 1931.—The larvae, taken from the blood of *Lepus washingtonii,* are assigned to the collective genus *Microfilaria.* It is possible that they are the immature forms of *Dirofilaria scapiceps.*

17554. **VOGEL, HANS.** Über Mikrofilaria demarquayi und die Mikrofilaria aus Tucuman in Argentinien. *Hamburg Univ. Abhandl. Gebiet Auslandsk.* 26: 573-584. 4 fig. 1927.—A detailed description is given of *M. demarquayi* and a comparison of that sp. with *M. loa, M. bancrofti,* and *M. verstans. Microfilaria* from Tucuman were studied, using the same fixatives. From various maximum, minimum, and average measurements it is concluded that *M. demarquayi* and *M. tucumana* are synonymous.—*B. G. Chitwood.*

ROTATORIA, GASTROTRICHA, ECHINODERA, AND CHAETOGNATHA

CHARLES H. BLAKE, *Editor*

(See also in this issue Entry 17492)

17555. GREY, B. B. Chaetognatha from the Society Islands. *Proc. Roy. Soc. Queensland* 42: 62-67. 12 fig. 1930(1931).—Nine spp. of *Sagitta* and one of *Pterosagitta* were collected in Papetoai Bay, Moorea Isl., including *Sagitta* oceania* (p. 63). A note is given on fertilization in *S. oceania* and *S. enflata*. Nematode parasites (*Camallanus trispinosus*) were found in *S. fridrici* and nematodes in *S. enflata* and *S. oceania*. *S. enflata* was observed to eat a specimen of *S. fridrici*.

17556. REMANE, ADOLF. Zweite Klasse des Cladus Plathelminthes [corrected to Nemathelminthes on errata slip]. Gastrotricha. In: *Kükenthal's Handbuch der Zoologie* 2(No. 5, pt. 4): 121-146. 30 fig.; (No. 6, pt. 4): 147-186. 49 fig. 1929.—A general treatment of the morphology, physiology, and classification, with very detailed comparative study of body form*, cuticular structures*, ciliation*, epidermis, musculature*, the Y-organs* and X-organs*, (fig. 133) nervous system*, sense organs*, alimentary system*, protonephridia*, sexual organs*, embryology*, growth, nourishment and excretion, geographic distribution, and phylogeny. The class is divided into 2 orders, and all groups are described. The order Macrodasyoidea contains the families Neodasyidae*, Lepidodasyidae*, Macrodasyidae*, **DACTYLOPODALIIDAE*** (p. 153, 176) (n. n. for Dactylopodellidae, with **DACTYLOPODALIA** (p. 123, 176) n. n. for *Dactylopodella* Remane; *Dactylopodalia* baltica (*Dactylopodella b.* Remane) (p. 136); *Dactylopodalia* typhle (*Dactylopodella t.* Remane) (p. 167)), Turbanellidae*, and Thaumastodermatidae*. The order Chaetonotoidea is divided into the families Xenotrichulidae*, Chaetonotidae*, Proichthydidae*, Dichaeturidae*, Neogosseidae*, and Dasydytidae*. The bibliography contains 72 titles. All included genera are listed under each family.

17557. REMANE, ADOLF. Dritte Klasse des Cladus Nemathelminthes. Kinorhyncha=Echinodera. In: *Kükenthal's Handbuch der Zoologie* 2(No. 6, pt. 4): 187-242. 50 fig. 1929; (No. 8, pt. 4): 243-248. 6 fig. 1930.—A general discussion of the morphology, physiology, and classification, largely based on Zelinka's monograph, with detailed comparative studies of body form*, segmentation*, epidermis*, anterior closing apparatus*, musculature*, nervous system*, sense organs*, mouth parts* and alimentary system*, excretory system*, sexual organs*, sexual dimorphism, embryology*, metamorphosis*, growth and habits, and geographic distribution. The group is considered a side branch from the same root as the Gastrotricha and Nematoda. Only one order, the Echinodera, is recognized, but it is divided into 3 suborders. The suborder Cyclorhagae contains tribe Nomosomata, with families Echinoderidae* and Centroderidae*, and tribe Xenosomata, with one family, Campyloderidae* (=Mesitoderidae). Suborder Conchorhagae contains only the **SEMNODERIDAE*** nom. nov. (p. 244) for Pentacontidae. Suborder Homalorhagae contains Trachydemidae and Pycnophyidae. The bibliography contains 29 references. Diagnoses of all genera and higher groups.

17558. WESENBERG-LUND, C. Erste Klasse des Cladus Nemathelminthes Rotatoria, Rotifera=Rädertierchen. In: *Kükenthal's Handbuch der Zoologie* 2 (No. 4, pt. 4): 8-18. 6 fig.; (No. 5, pt. 4): 19-120. 124 fig. 1929.—A monographic general description of the comparative morphology, with detailed description of the body wall*, foot glands*, trochal disc*, mastax*, nervous system*, intestinal canal*, excretory system*, musculature*, sense organs*, sexual organs*, cell structure*, sexual dimorphism, embryology and development, metamorphosis, nourishment, cyclomorphosis, polymorphism, growth, regeneration, bathymetric distribution, biocoenosis, parasitism, and phylogeny of the class. The class is divided into 6 orders. Order Notommatida contains suborder Notommatinae, with families Notommatidae* and Synchaetadae*. Suborder Rattulinae, with families Rattulidae* and Dinocharidae*; suborder Euchlaninae with Salpinadae*, Euchlanidae*, and Colurellidae*; suborder Anopodinae with Anopodidae*. Order Brachionida with Hydatinadae* and Brachionidae*. Order Asplanchniformes contains suborder Gastropodinae with Gastropodidae*, and Ploesomatidae*; suborder Asplanchninae with Harringiidae*, and Asplanchnadae*. Order Melicertacea contains Melicertidae*, Pedalionidae*, Pterodinadae*. The order Floscullariacea contains the Floscullariadae*, and Apsilidae*. Order Bdelloida contains the Adinetidae*, Philodinadae*, and Microdinadae*. The Seisonidae*, Trochosphaeridae*, and Microcodidae* are not fitted into the classification. Each of the above groups is defined. The bibliography contains 87 references. All included genera are listed under each family.

(See also in this issue Entries 16460, 16592, 17284, 17463, 17466, 17471, 17575, 18112, 18114)

17559. BOARDMAN, W. Two new species of the genus Notoscolex (Oligochaeta) from Ulladulla, New South Wales. *Rec. Australian Mus.* 18(4): 161-166. 6 fig. 1931.—*Notoscolex* ulladullae* (p. 161) and *N.* attenuatus* (p. 163), types in Australian Mus.

17560. HERTER, KONRAD. Vergleichende bewegungsphysiologische Studien an deutschen Egeln. *Zeitschr. Wiss. Biol. Abt. C, Zeitschr. Vergleich Physiol.* 9 (2/3): 145-177. 15 fig. 1929.—Comparative studies were made on the movements of the following German leeches: *Piscicola geometra, Protoclepsis tesselata, Glossosiphonia complanata, G. heteroclita, Helobdella stagnalis,* and 2 species of *Herpobdella*. Movements of rest, respiration, brooding, coiling, diving, seeking, fright, food-procurement, crawling and swimming are described. Agreements and differences in the postures and movements of the different species are discussed and their relations to the manner of life of the leech explained.—*K. Herter (transl. by J. P. Moore).*

17561. LANGHAMMER, H. Teilungs- und Regenerations-Vorgänge bei Procerastea halleziana und ihre Beziehungen zu der Stolonisation von Autolytus prolifer. *Wiss. Meeresuntersuch., Abt. Helgoland* 17(1. paper 1): 5-44. 3 pl. 1928.—In *P. halleziana* from Helgoland, the division plane is situated in the great majority of cases on the 9th, 11th, 13th or, mostly, the 16th segment. On the full-grown worm constrictions at intervals give the impression that the whole body is built up not simply of ordinary equal segments but of groups of segments. From head to tail there are, after the first 7 segments, 3 groups of 2 each, 3 groups of 3, several groups of 4, and again several groups of 3 segments each. In division, the tail piece generally includes 20 segments. The shortest pieces able to regenerate consist of 5 segments. Division is not suppressed by stolonization. Tables of the regeneration of the different body regions are given and compared with the results of Allen, obtained in Plymouth. The grouping

of segments occurs also in *Autolytus* and *Pionosyllis stylifera*, in which it is indicated by constrictions of the intestine or pigment-concentrations. The author holds that grouping of segments is phylogenetically old because of: (a) Its connection with sexual maturity; and (b) its uniformity in different groups of syllids where the mode of stolonization is different (stolonization-mode being younger than grouping of segments). Epigamic propagation, in agreement with Malaquin, the author derives from schizogamic. The results in the main points are in agreement with the results of Allen in Plymouth on the same subject.—*A. Meyer.*

17562. LIVANOW, N. Die Organisation der Hirudineen und die Beziehungen dieser Gruppe zu den Oligochäten. *Ergebnisse u. Fortschritte Zool.* [*Jena*] 7(4): 378-484. 33 fig. 1931.—A review of the literature and a comparative study of the morphology and anatomy of the Hirudinea with special attention to the somite number*, the differentiation of the body regions*, mesenchymal structure*, musculature, coelom*, circulatory system*, alimentary system*, nephridial system*, nervous system*, sense organs*, sexual organs*, chromosome numbers, and the relations of the Acanthobdellea in Hirudinea to the Branchiobdellidae in Oligochaeta. The bibliography contains 207 references.

17563. UDE, H. Die Oligochäten der Arktis und ihre geographische Verbreitung. II. *Fauna Arctica* 6(1): 41-54. Gustav Fischer: Jena, 1931.—A list of Naididae, Enchytraeidae, Tubificidae, Lumbriculidae, and Lumbricidae, with distributional records.

BRACHIOPODA, BRYOZOA, PHORONIDEA

R. C. OSBURN, *Editor*

(See also in this issue Entries 17278, 17280, 17283, 17284, 17288, 17290, 17477, 18114, 18115)

BRACHIOPODA

17564. GIRTY, GEORGE H. The fauna of the middle Boone near Batesville, Arkansas. *U. S. Geol. Surv. Prof. Papers* 154B. 73-103. 4 pl. 1928.—This fauna is from the limestone near the middle of the Boone chert of the upper Boone of the same region, and also from the typical Boone. It comprises 45 spp. or varieties, almost all brachiopods, the spirifers being most abundant as to numbers, and the producti as to variety, but few corals, bryozoans and gastropods also occur. Lists of other Mississippian faunas of the region are given for comparison, and correlations of these beds with the standard section, particularly the Burlington and Keokuk, are discussed. The author gives short descriptions of a number of forms, 23 of which are figured. Brachiopoda: *Schizophoria* **compacta** (p. 81); *Chonetes* **miseri*** (p. 81); *C.* **batesvillensis*** (p. 82); *Pustula* **incrassata*** (p. 86); *Spirifer* **incertiformis*** (p. 88). Mollusca: *Platyceras* **oxynotum*** (p. 95). Brachiopod specimens are also described under the following "MS." names: *Schizophoria* **compacta** (p. 81), *Spirifer washingtonensis* v. **incomptus*** (p. 89), and *Reticularia setigera* v. **internascens*** (p. 91).

17565. GUGENBERGER, ODOMAR. Die Cardita-Schichten von Launsdorf in Mittelkärnten und ihre Fauna. I. Brachiopoden. *Akad. Wiss. Wien Math.-Naturwiss. Kl. Sitzungsber. I. Abt.* 139(1/2): 43-131. 1 pl. 1930.—H. v. Gallenstein collected and prepared this rich Triassic fauna between 1906 and 1922 and published a preliminary study of it. Since his death, a detailed study of the 3000 brachiopods in the collection has been made by the author. The assemblage comes from 5 localities, is predominantly a microfauna, and includes 114 spp. in 19 genera. The systematic section includes descriptions and taxonomic notes. *Lingula* **rotunda*** (p. 47); *L.* **lacrimae*** (p. 48); *L.* **carinthiaca*** (p. 48); *Discina* **ovoides*** (p. 49); *Thecidea* **schafferi*** (p. 51); *T.* **kahleri*** (p. 51); *T.* **carinthiaca*** (p. 52); *Spiriferina* **carinthiaca*** (p. 54); *S. batiotica* Bittner, emended description; *S.* **gallensteini*** (p. 56); *Mentzelia mentzeli**, with table of 11 varieties; *Cyrtina* **multicostata*** (p. 64); *C.* **ampfereri*** (p. 66); *C.* **cassiformis*** (p. 68); *C. cyrtioides*, emended description; *Thecocyrtella* **pseudo-ampezzoana*** (p. 72); *Retzia* **toulae*** (p. 82); *R.* **launsdorfi*** (p. 84); *Amphiclina* **carinthiaca*** (p. 90); *A. intermedia* Bittner (=*A. haberfelneri* Bittner, *A. h.* var. *minor* Bittner, and *A. intermedia* var. *praeceps* [author?]); *A.* **amphiclinodontoides*** (p. 95); *Amphiclinodonta* **gallensteini*** (p. 96); *A.* **multidentata*** (p. 96); *A.* **kieslingeri*** (p. 97); *A.* **geyeri*** (p. 98); *A.* **arthaberi*** (p. 101); *A.* **elegantissima*** (p. 101); *A.* **primitiva*** (p. 103); *Thecospira* **gallensteini*** (p. 105); *Thecospirella loczyi* v. **amphitoma** (*Thecocyrtella a.* Gallenstein) (p. 110); *T. l.* var. **compressa*** (p. 110). An outline of the development of teeth in *Amphiclinodonta* is given. Bibliography of 71 titles.

17566. HAYASAKA, ICHIRÔ. On a new Carboniferous brachiopod fauna from the Ashio Mountains, Japan. *Proc. Imp. Acad.* [*Tokyo*] 2(10): 551-553. 1926.—The list of brachiopods from this locality is: *Productus punctatus* Martin, *Meekella eximia* f. **majuscula** (p. 552), *Orthotetes simensis* Tschernyschew, *Schizophoria resupinata* (Martin) Davidson, *Spirifer* aff. *rockymontanus* Marcou, and *Reticularia lineata* Martin.

17567. SCHUCHERT, CHARLES, and G. ARTHUR COOPER. Synopsis of the brachiopod genera of the suborders Orthoidea and Pentameroidea, with notes on the Telotremata. *Amer. Jour. Sci.* 22: 241-251. 1931.—A preliminary statement of results to be presented later in an extensive monograph. The following classification is offered, with description of new genera and species. Order Protremata.—**ORTHOIDEA** (p. 241) n. suborder: superfam. Orthacea containing 10 families, 5 of which are new, (1) **NISUSIIDAE** (p. 242) (*Nisusia, Jamesella*); (2) **PROTORTHIDAE** (p. 242) (*Protorthis, Loperia*); (3) Billingsellidae (*Billingsella*); (4) **EOORTHIDAE** (p. 242) with the subfams. **ORUSIINAE** (p. 242) (*Orusia*) and Eoorthinae (*Eoorthis, Otusia,* ? *Wimanella,* **BOHEMIELLA** (p. 242), type *Orthis romingeri* Barr., **OLIGOMYS** (p. 243), type *Orthis exporrecta* Linnar.); (5) Plectorthidae with 5 subfams., **FINKELNBURGIINAE** (p. 243) (*Finkelnburgia*), Plectorthinae (*Plectorthis, Hebertella, Mimella, Schizophorella, Doleroides*), **CYCLOCOELIINAE** (p. 243) (*Cyclocoelia*), Platystrophiinae (*Platystrophia, Mcewanella*), Orthostrophiinae (*Orthostrophia*); (6) Skenidiidae (*Skenidium,* **SKENIDIOIDES** (p. 243), type *S.* **billingsi** (p. 243), from Black River limestone of Paquette Rapids, Ontario, type in Yale Univ. Mus.); (7) Orthidae, divided into 6 subfams. all of which are new, **ORTHINAE** (p. 243) (*Orthis, Nicolella, Glossorthis,* **CYRTONOTELLA** (p. 243), type *Orthis semicircularis* (Eichwald), **PAURORTHIS** (p. 243), type *Orthambonites parva* Pander, **ARCHAEORTHIS** (p. 243), type *Orthis electra* Billings), **PRODUCTORTHINAE** (p. 243) (*Productorthis,* **PANDERINA** (p. 243), type *Productus abscissus* Pand.), **ANGUSTICARDINIINAE** (p. 243) (**ANGUSTICARDINIA** (p. 243), type *Porambonites recta* Pand.), **TAFFIINAE** (p. 243) (*Taffia, Eostrophomena*), **HESPERORTHINAE** (p. 243) (*Schizoramma,* **HESPERORTHIS** (p. 243), type *Orthis tricenaria* Conrad, **DOLERORTHIS** (p. 243), type *Orthis interplicata* Foerste), and **GLYPTORTHINAE** (p. 243) (*Glyptorthis, Eridorthis,* **PTYCHOPLEURELLA** (p. 243), type *Orthis bouchardi* Davidson); (8) **DINORTHIDAE** (p. 244) containing the following genera, *Dinorthis* (divided into 5 subgenera: *Dinorthis, Plaesiomys,* **PIONORTHIS** (p. 244), type *Orthis sola* Billings, **RETRORSIROSTRA** (p.

244), type *Orthis carleyi* Hall, and *Marionella* Bancroft), *Valcourea*, **MULTICOSTELLA** (p. 244), type *Orthis ? saffordi* Hall & Clarke, *Austinella, Palaeostrophomena*, **PLANIDORSA** (p. 244), type *P. bella* (p. 244); (9) Porambonitidae (*Porambonites, Noetlingia*); (10) **LYCOPHORIIDAE** (p. 245) (*Lycophoria*). Superfam. Clitambonacea, with families **DELTATRETIDAE** (p. 245) (*Deltatreta*), Clitambonitidae, divided into 3 subfamilies: Plectellinae (*Plectella, Ingria*), **CLITAMBONITINAE** (p. 245) (*Clitambonites, Vellamo, Orthisina, Hemipronites, Polytoechia*, **ESTLANDIA** (p. 245), type *Orthisina marginata* Pahlen, **PAHLENELLA** (p. 245), type *Orthis trigonula* Pahlen, **APOMATELLA** (p. 245), type *Orthisina ingrica* Pahlen), **GONAMBONITINAE** (p. 245) (*Gonambonites*). Superfam. **DALMANELLACEA** (p. 245) with families Dalmanellidae, *Dalmanella* (type *Orthis rogata* Sardeson), *Proschizophoria, Heterorthina*, **CARINIFERELLA** (p. 246) (type *Orthis carinata* Hall), **AULACELLA** (p. 246) (type *Orthis eifelensis* Schnur.), **LEVENEA** (p. 246) (type *Orthis subcarinata* Hall); **WATTSELLIDAE** (p. 246) with *Horderleyella, Wattsella, Idiorthis, Mendacella*, **PARMORTHIS** (p. 246) (type *Orthis elegantula* Dalman), **FASCICOSTELLA** (p. 246) (type *Orthis gervillei* Defrance); **BILOBITIDAE** (p. 246), with *Bilobites*; **MYSTROPHORIDAE** (p. 246), with *Mystrophora*, and ? *Kayserella*; Rhipidomellidae, with *Rhipidomella* containing the subg. **PERDITOCARDINIA** (p. 246) (type *Orthis dubia* Hall), *Thiemella*, and **PLATYORTHIS** (p. 246) (type *Orthis planoconvexa* Hall); **HETERORTHIDAE** (p. 246), with subfamilies **HETERORTHINAE** (p. 246) (*Heterorthis*) and Harknessellinae (*Harknessella, Reuschella, Smeathenella*); Schizophoriidae, with subfams. Schizophoriinae (*Pionodema, Schizophoria, Orthotichia*, **AULACOPHORIA** (p. 246), type *Orthis keyserlingiana* De Koninck), Enteletinae (*Enteletes, Enteletella, Enteletoides, Parenteletes*, **ENTELETINA** (p. 247), type *Enteletes latesinuatus* Waagen.), **ISORTHINAE** (p. 247) (*Isorthis*); **LINOPORELLIDAE** (p. 247), with **LINOPORELLA** (p. 247), type *Orthis punctata* Verneuil, ? *Orthotropia*. Suborder **PENTAMEROIDEA** (p. 247), superfam. **SYNTROPHIACEA** (p. 247), fam. **CLARKELLIDAE** (p. 247) with *Clarkella, Yangtzeella, Syntrophina*, and **SYNTROPHIOIDES** (p. 247), type *Billingsella harlanensis* Walcott; Syntrophiidae, with *Syntrophia*; **HUENELLIDAE** (p. 247), with *Huenella* and **HUENELLINA** (p. 247), type *Huenella triplicata* Walcott. Superfam. Pentameracea, fams. Camerellidae with *Camerella* Billings (syn. *Parastrophia*), *Anastrophia, Metacamerella*, ?*Branconia*, **RHYNCHOCAMARA** (p. 248), type *R.* plicata (p. 248), **PARASTROPHINELLA** (p. 248), type *Pentamerus reversus* Bills.; Stricklandiidae, with *Stricklandia*; Pentameridae, containing the subfams. Gypidulinae, with *Clorinda, Barrandella, Gypidula, Sieberella, Pentamerella* ?*Zdimir*, and **?LIOCOELIA** (p. 248), type *Pentamerus proximus* Barr., Pentamerinae with *Pentamerus, Capelliniella, Holorhynchus, Harpidium, Conchidium, Brooksina, Platymerella, Cymbidium, Virgiana*, **PENTAMEROIDES** (p. 248), type *Pentamerus oblongus subrectus* Hall & Clarke, **LISSOCOELINA** (p. 248), type *Pentamerus pergibbosus* Hall & Whitefield, **RHIPIDIUM** (p. 248), type *Pentamerus knappi* H. & W. Hall and Clarke's belief that the rhynchonellids probably arose in the orthids is confirmed, and the superfamily Rhynchonellacea is found to be apparently of polyphyletic origin, one of the lines of descent starting in the family Orthidae and another in the Plectorthidae; neither of these, however, is the main line that goes into *Camarotoechia*, which is as yet not known. The suggestion is made that the pentamerids had their beginning in the wide-hinged Syntrophiacea, some of which evolved into the Camerellidae; and the further suggestion is made that it was also in these camerellids that the spire-bearers arose. The Terebratulacea may have come out of camerellid-like shells, or out of early Spiriferacea. Two new terms are proposed for kinds of punctae: "endopunctae," for those of the internal shell layer; "exopunctae," for those that indent the external shell surface but do not pass through it.—*C. Schuchert.*

BRYOZOA

17568. CALVET, LOUIS. Bryozoaires provenant des campagnes scientifiques du Prince Albert Ier de Monaco. *Résultats Campagnes Sci. Albert Ier, Prince de Monaco, Fasc.* 83. 1-152. 2 pl. 1931.—Notes are given on the many species of Bryozoa collected during these expeditions, and also on 2 spp. of hemichordates belonging to the fam. Rhabdopleuridae. The following Bryozoa are reported and described in more detail: *Crisella* borgi* (p. 20), 16° 44′ N, 24° 44′ W.; *Diplosolen grimaldii**; *Scrupocellaria ? cervicornis* v. spinosa (p. 66) and *Hippoporina* bassleri (p. 84), Cape Verde Isls., *Cryptosula* cylindrica* (p. 85), Atlantic Ocean, 33° 47′ N, 14° 21′ W.; *Microporella* (?) flustroides* (p. 87), Azores; *Smittina avicularia**; *Jaculina* dichotoma* (p. 97), Azores; *Retepora cellulosa*; *R. rara*; *R. marsupiata*; *R.* alberti* (p. 103), Canary Isl.; *Reteporella* jullieni (p. 105) and *Schizellozoon* dentatum* (p. 107), Azores; *S. tessellatum* (Hincks) "var. nov."* described but not named; ?*Phylactella* vibraculata* (p. 113), Azores; *Holoporella pigmentaria* v. albida (p. 117), Cape Verde Isls.; *Schismopora* (*Cellepora*) coronopusoida* (p. 119), near Monaco.

17569. CORI, CARL J. Dritter Cladus der Vermes Amera, Kamptozoa. Allgemeines über den Cladus Kamptozoa. Erste und einzige Klasse des Cladus Kamptozoa. Kamptozoa = Bryozoa Entoprocta = Calyssozoa. In: *Kükenthal's Handbuch der Zoologie* 2 (No. 6, pt. 5): 1-64. 76 fig. 1929.—Entoprocta or Calyssozoa are taken from the Polyzoa or Bryozoa and made a cladus called **KAMPTOZOA** (p. 5), with a single class also called **KAMPTOZOA** (= Bryozoa Entoprocta = Calyssozoa) (p. 4). A general discussion of the morphology, physiology, and classification of the group. Detailed comparative descriptions are given of the calyx* ("Kelch"), tentacles*, stem*, stolon*, cell structures*, nephridium*, gonads*, parenchyma cells*, musculature*, embryology*, metamorphosis*, regeneration*, respiration, nourishment, locomotion, geographic distribution of *Pedicellina** and *Barentsia**, and phylogeny. The group is divided into solitary and colonial genera, but no order or family is specified. The 12 included genera are described and figured, and spp. listed. The bibliography contains 66 titles. Under each family, all included genera are listed.

17570. CORI, CARL I. Kamptozoa (Entoprocta). In: **GRIMPE, G., u. E. WAGLER. Die Tierwelt der Nord- u. Ostsee.** Lief. 19. Pt. IVa. Pp. 1-68. 65 fig. 1930.—The name Kamptozoa is substituted for Entoprocta [See preceding article in this issue.] and the group is removed from the Bryozoa and made part of the Vermes Amera. The species of the North and Baltic Seas are listed according to country. Although the general discussion of morphology and anatomy and also the illustrations are the same, the present article differs from the previous paper in that the genera are arranged in groups all in one family, Pedicellinidae. Under Loxosoma-typus is arranged *Loxosoma* and *Loxosomella*; under Pedicellina-typus, *Pedicellina*; under Myosoma-typus, *Myosoma, Chitaspis, Loxosomatoides*; under Barentsia-typus, *Barentsia* Hincks (= *Pedicellinopsis* Hincks); under Urnatella-typus, *Urnatella*. The genera *Ascopodaria, Gonypodaria*, and *Arthropodaria* are sunk under *Barentsia*. All species from the region under consideration are described and figured. The bibliography contains 90 references.

17575. **BINARD, ALICE, et RAYMOND JEENER. Rapports morphologiques du système nerveux des mollusques avec celui des polychètes.** *Recueil Inst. Zool. Torley-Rousseau* [*Bruxelles*] 3(1): 5-16. 2 pl. 1930.—The researches of Storch upon the nervous system of the amphinomides throw new light upon the morphological similarity of mollusks and polychaetes. The 4 longitudinal cords of the Amphineura should be considered as homologous to the 4 nerve trunks of the amphinomides; the 2 lateral cords are lacking in the other classes of mollusks, their visceral commissure being a superadded element to the fundamental system of 4 simple cords.—*A. Binard.*

17576. **[BODYLEVSKIĬ, V. I.] БОДЫЛЕВСКИЙ, В. И. Развитие Cadoceras elatmae Nik. [The development of C. elatmae.]** [English summary.] Ежегодник Русского Палеонтологического Общества (*Ann. Soc. Paléont. Russie*) 5(1): 61-94. 2 pl., 1 fig. 1925(1926).—A study of the individual development of the shell was made by a mensuration determining the variation in chambers and its relation to the bifurcation of ribs. Adult specimens show the living chambers to attain a length about equal to ¾ of the whorl, and to be terminated by a constriction. A similar constriction also appears at what is considered the termination of the first living chamber. This is interpreted as marking a suspension of growth at the moment of transition from the embryonic to the postembryonic stage. The development of the suture line is described and figured. The author regards *Stephanoceras-Cadoceras-Quenstedticeras* as a genetic series.

17577. **BOYCOTT, A. E. A re-survey of the fresh-water Mollusca of the parish of Aldenham after ten years with special reference to the effect of drought.** *Trans. Hertfordshire Nat. Hist. Soc. and Field Club* 19(1): 1-25. Map, 4 fig. 1930.—The molluscan fauna of 98 ponds (84 of which are isolated) changed but little in 10 yrs. The total number found in ponds which are apt to dry up decreased, that in the non-drying ponds increased. Drying ponds contain fewer snails and plants than non-drying ponds. Evidence is given that small ponds slowly gain fresh species until they are "full," which is reached when 8-10 species are present. The mechanism of the drying of ponds is discussed in relation to weather conditions.—*A. E. Boycott.*

17578. **COCKERELL, T. D. A. Helix nucleata Turton.** *Nautilus* 40(1): 31. 1926.—A bibliographical note.

17579. **COEN, GIORGIO S. Gibbula (Forskaliopsis nov. sect.) bellinii n. sp. Nuovo gasteropodo marino di Capri.** *Ann. Mus. Zool. R. Univ. Napoli* 6(4): 1-2. 2 fig. 1930.—**FORSKALIOPSIS,** n. section in *Gibbula; G.* (*F.*) **bellinii** (p. 2).

17580. **COX, L. R. The fossil fauna of the Samana Range and some neighbouring areas: Part IV. Lower Albian Gastropoda and Lamellibranchia.** *Mem. Geol. Surv. India, Palaeont. Indica* 15: 39-49. 1 pl. 1930.—The author lists 6 Gastropoda and 4 Lamellibranchia, with synonymies, descriptions, taxonomic remarks, and figures of each. Only 2 of the forms are specifically determined.

17581. **GALLIEN, L. Présence d'un mollusque opisthobranche du genre Alderia Allman dans la baie de Sallenelles (côte du Calvados). Note préliminaire.** *Bull. Soc. Linn. Normandie* 1: 18-22. 1928(1929).—The species is described but not named, and ecological conditions are given.

17582. **GALLIEN, L. Sur deux espèces intéressantes de la faune des vases salées de Sallenelles.** *Bull. Soc. Linn. Normandie* 1: 31-32. 1928(1929).—Notes on *Limapontia depressa,* rediscovered, and *Ochthebius punctatus,* new to France.

17583. **GALLIEN, LOUIS. Étude de deux mollusques opisthobranches d'eau saumâtre.** *Bull. Soc. Linn. Normandie* 1: Trav. Orig. 162-190. 1928(1929).—*Alderia modesta* and *Limapontia depressa,* redescribed. The ecology, ethology, foods, reproduction, oviposition, development, and geographic distribution of these species are discussed.

17584. **GAMBETTA, LAURA. Malacofauna cirenaica. Una nuova specie di Helix.** *Ann. Mus. Civ. Storia Nat. Genova* 52: 236-238. 2 fig. 1925/1928.—*Helix* (*Cryptomphalus*) **antii*** (p. 236), Cyrenaica.

17585. **GOODRICH, CALVIN. Goniobases of the vicinity of Muscle Shoals.** *Occ. Papers Mus. Zoöl. Univ.*

Michigan No. 209. 1-25. 1930.—This paper discusses the status and relationships of 9 spp. and 2 subspp. of *Goniobasis,* which are recognized from the tributaries of the Tennessee River, between Jackson Co. and Franklin Co., Alabama. Extensive synonymies are collated from comparisons of the species described by earlier authors with the variation in extensive series of specimens. Six additional species are considered doubtful and 3 others are described as probably new.—*H. B. Baker.*

Fusidae: **NIVITRITON** (p. 288), type *Triton antiquatus* Hinds. Nassariidae: **ALLANASSA** (p. 289), type *Nassa eximia* H. Adams from New Hebrides; **GRAPHICOMASSA** (p. 289), type *Colombella ligula* Duclos; **LAVESOPUS** (p. 289), type *C. spicula queenslandica* Hedley; **TRANSTRAFER,** type *T.* longmani* (p. 290). Obeliscidae: *Dolabella* andersoni (p. 292). Land shell: *Hadra* mortenseni* (p. 292). Almost none of these "new genera" is defined; most of them appear to be monotypic; and few of the inferred new combinations are actually used by the author.—*H. B. Baker.*

17588. **JAYET, AD.** La variation individuelle chez les Ammonites et la diagnose des espèces. Note préliminaire basée sur l'analyse d'Inflaticeras varicosum (Sowerby). *Abhandl. Schweizer. Paleont. Ges.* 49(Mem. 3): 1-11. 9 fig. 1929/1930.—A study of 300 specimens of the Lr. Cretaceous (Albian) ammonite *Inflaticeras varicosum* (Sowerby) from a 45 cm. bed at Perte du Rhône, France, with respect to variations in the cross-section, the number and inclination of the ribs, the suture, and the stages of development. Two varieties are recognized, multicostata* (p. 4) and crassicostata* (p. 4), and under each 6 unnamed variants of secondary order combining respectively thick, medium, or narrow cross-section with straight or with flexuous ribs. With this inclusive concept in mind the author examines various citations in the literature and proposes to suppress *Ammonites binus** Sowerby, *A. senequieri* D'Orbigny, *Brancoceras aegoceratoides* Steinmann, *Schloenbachia* (*Brancoceras*) *laferrei* Boule, Lemoine, and Thévenin, *Brancoceras orbignyi* Spath, *B. bucklandi* Spath, *B. helcion* (Reynès), *B. thisbe* (Reynès), *Hysteroceras choffati* Spath, *Brancoceras binodosum* Stieler as synonyms of *I. varicosum.* He rejects the genera *Hysteroceras* Hyatt, *Hystatoceras* Hyatt, *Brancoceras* Steinmann as included in *Inflaticeras* Stieler. The general conclusion is drawn that a sufficiently complete suite of individuals of an ammonite species will show variations that form a continuous series, which series must be considered to constitute the species. A species is not to be defined from a single specimen and the plan of designating a type specimen to represent the species is unsatisfactory because it leads to the designation as species of mere varietal forms.—*J. B. Reeside, Jr.*

17589. **JOUSSEAUME, [FELIX].** Cerithiidae de la Mer Rouge. *Jour. de Conch.* 74(4): 270-296. 3 fig. 1930. —These extracts from a manuscript left by Jousseaume (with anonymous notes) include emended descriptions, records and discussions of many species. *Cerithium* madreporicola* (p. 275); *C.* fallacies* (p. 278); *C.* proteum* (p. 283); *C.* sergentum (p. 284), n. n. for *C. lineatum* Tryon; *Colina* perimensis (p. 285), n. n. for *Cerithium taeniatum* Sow.; *Pirenella layardi,* vars. djiboutiensis and adenensis (p. 293); *P. cinerascens,* vars. lineolata (p. 293), nigro-cincta, luteo-annulata, and lutea (p. 294).—*H. B. Baker.*

17590. **JULLIEN, A.** Sur l'épithélium du manteau de la seiche. *Bull. Soc. Zool. France* 53: 82-87. 6 fig. 1928.—The different cells of the epithelium (ungranulated, granulated, and calciform) represent the evolutionary stages of the same cell, that of the striated level without granulations. As in the embryo, all these cells

undergo the mucous transformation; this mode of change resembles that of the striated level in the intestinal mucosa of the higher vertebrates.—*A. Jullien (transl. by S. A. Watson).*

17591. KÄNDLER, RUDOLF. Die Kultur der Auster. In: EMIL ABDERHALDEN. Handbuch der biologischen Arbeitsmethoden. Abt. IX. Methoden der Erforschung der Leistungen des tierischen Organismus. Teil 5, Heft 5. 599-716. 54 fig. Urban & Schwarzenberg: Berlin, 1930. —An extensive summary of literature on the biology and culture of: *Ostrea edulis* in France, Belgium, Holland, Great Britain, Denmark, Norway, Italy; *O. virginica* on the Atlantic coast of North America; *O. lurida* and *O. gigas* introduced from Japan, on the Pacific coast; and several species in Japan. A 12 page summary of knowledge of the biology and of the distribution of oysters lays emphasis upon temp. barriers and the importance of currents. Detailed account is given of the culture of *O. edulis* from Roman times, showing progressive depletion of all European natural oyster beds, reaching a climax in the heavy mortality of natural and planted oysters in France and England in 1920-21. Coincident with decrease in *O. edulis* has been invasion of the inferior Portuguese oyster, *O. angulata,* which now comprises bulk of oysters produced in France. Chief development of industry effected through use of brush and cement covered tiles for cultch and of artificial claires for fattening or producing Marennes greening. Most favorable conditions are now in Holland, where high water temp. and abundant food are found. Seed oysters are exported from Holland to neighboring countries. An important natural experiment occurred on the Danish west coast when the sea broke through into the Limfjord in 1825 followed by building up of numerous natural oyster banks. Save in Germany, where American methods are employed, European and Japanese oyster culture involves much hand labor and is costly. Natural beds in America greatly depleted, with subsequent development of private planting. Production of over a million tons in 1875 has decreased by two fifths. Chief enemies of oyster are: slipper limpet in England, the starfish, drill, mussel, mudworm, and drumfish in America. Chief differences between Old and New World methods of culture are: much hand labor and marketing oysters in the shell in Europe; large scale production with machine power and shucking of oysters in America, leaving the shells to provide cultch for obtaining spatfall. The final chapter on research emphasizes the studies of the development and of the food of oyster larvae carried on at Conway, Helgoland, and at Milford, Connecticut.—*T. C. Nelson.*

17592. [KHUDÍAEV, I.] ХУДЯЕВ, И. О некоторых верхнемезозийских ископаемых из района р. Оби. (Some upper Mesozoic fossils from the region of the river Ob.) [English summary.] Труды Ленинградского Общества Естествоиспытателей. Протоколы заседаний, научные статьи и сообщения (*Trav. Soc. Natur. Leningrad, Compt. Rend. Séanc.*) 59(1): 127-135. 1 pl., 3 fig. 1929.—A collection of fossils from the Beresovsky district, Tobolsk Province, Siberia, contains: *Blanfordia* **tobolica*** (p. 129), and *Ostrea leymerii* v. **sibirica** (p. 132), both apparently Neocomian. The collection, types included, is in the Geol. Cabinet, Leningrad Univ.

17593. KISHITANI, TEIJIRO. On the luminous organs of Watasenia scintillans. *Annot. Zool. Japonensis* 11(4): 353-361. 3 pl. 1928.—*W. scintillans* (Berry) possesses 3 kinds of luminous organs of different construction, all organs of intracellular luminescence. The existence of luminous symbiotic bacteria in the luminous organs can not be demonstrated either histologically or bacteriologically. It is as yet open to question whether the spindle-shaped granules and the rods may play an important rôle in the production of light or if they merely function as a reflector.—*Author's summary.*

17594. KURODA, J. T. Catalogue of the shell-bearing Mollusca of Amami-Oshima (Oshima, Ôsumi). [Text in Japanese.] 126p. Special Publ. Kagoshima-Ken Educational Investigation Comm.: Kagoshima, 1928.—Eleven hundred and forty-eight species and subspp. are recorded. —*S. S. Berry.*

17604. **POLIŃSKI, WLADYSLAW. Limnološka ispitiwanja Balkanskog Poluostrva. 1. Reliktna fauna gasteropoda Ohridskog Jezera. [Relict gastropod fauna of Lake Ochrida.]** [French summary.] *Bull. Acad. Royal Serbe Sci. Arts, Beograde* 137(65): 131-182. 1929.—This fauna consists of 26 spp., most of which are known only from Lake Ochrida. Only a few spp. have affinities with the Balkan molluscan fauna. The endemic elements in the fauna represent the remains of a Pliocene freshwater and brackish-water fauna of Jugoslavian and Pannonian territories. With the exception of Lake Baikal, this is the only Palaearctic lake which has preserved intact to this day its archaic fauna of Tertiary Prosobranchiata and Pulmonata. Valvatidae: *Valvata* (*Cincinna*) stenotrema (p. 135) [spelled *strenotrema* here by typographical error]; *V.* (*Atropidina*) ochridana (p. 136); COSTOVALVATA (p. 137), n. subg. of *Valvata*, type *V.* (*C.*) hirsutecostata (p. 138), including also *V.* (*C.*) *rhabdota* Stur. Hydrobiidae: *Hydrobia* (*Hydrobia*) grochmalicki (p. 139); *Pseudamnicola sturanyi* redescribed. TRACHYOCHRIDIA (p. 142), n. subg. of *Micromelania*, type *M.* (*T.*) filocincta (p. 142); STANKOVIĆIA (p. 143), in subf. Baicaliinae, type *S.* baicaliiformis (p. 144); XESTOPYRGULA (p. 147), n. subg. of *Pyrgula*, type *P.* (*X.*) dybowskii (p. 148), including also *P. pfeiferi, P. barroisi, P. radići*, and *P. fuchsiana; P.* (*P.*) pavlovici (p. 151); *P.* (*P.*) wagneri (p. 152); BRACHYPYRGULA (p. 153), n. subg. of *Pyrgula*, type *P. bicarinata* Desmoul.; MICROPYRGULA (p. 154), n. subg. of *Pyrgula*, type *P.* (*M.*) stankovići (p. 154), including also *P. pyrenaica, P. darrieuxi*, and *P. hungarica;* NEOFOSSARULUS (p. 156), related to *Fossarulus*, type *N.* stankovići (p. 157). Limnaeidae: *Radix* relicta (p. 158). Planorbidae: CARINOGYRAULUS (p. 161), n. subg. of *Gyraulus*, type *G.* (*C.*) trapezoides (p. 162), including also *G. paradoxus* Stur., *G. lychnidicus* Hesse, and *G.* (*C.*) relictus (p. 164). Ancylidae: *Ancylus* tapirulus (p. 165); *Acroloxus* improvisus (p. 166). Types of new spp. in Polish Nat. Mus. Zool.

17605. **SAEZ, MATHILDE D. de. Orthoceras paleozoicos de San Juan.** *Notas Prelim. Mus. La Plata* 1(2): 241-254. 4 fig. 1931.—*O.* clarkei* (p. 243), *O.* cuyanus* (p. 244), *O.* cabrerai* (p. 246); SPIROPLEROCERAS (p. 251), type *S.* keideli* (p. 251); all Devonian. Other *Orthoceras* specimens are described but not named.

17606. **SEITZ, O., und R. RUTSCH. Die Gattung Amotapus Olsson, eine echte alttertiäre Mya (Raetomya) Linne.** *Eclogae Geol. Helvetiae* 23(2): 594-604. 1 pl., 2 fig. 1930.—The genus *Amotapus* Olsson 1928 is synonymous with *Raetomya* B. Newton 1919. *Raetomya* is proposed as a subgenus of *Mya* with 4 representatives in the Eocene, 1 from the Fayûm, Nigeria, and German South-West Africa, 1 from South-West Africa, 1 from Peru, and 1 *Mya* (*Raetomya*) *schweinfurthi* v. falconensis* (p. 602) from Venezuela.—*W. Berry.*

17607. **SPATH, L. F. On some Ammonoidea from the Lower Greensand.** *Ann. & Mag. Nat. Hist.* 5(29): 417-464. 4 pl. 1930.—Discusses stratigraphic occurrence, and describes the following spp. of Aptian (mid Lower Cretaceous) Ammonoidea from the south of England. Parahoplitidae: *Deshayesites* grandis* (p. 427), *D.* kiliani* (p. 429), *D.* topleyi* (p. 430), *D.* vectensis* (p. 430), *D.* punfieldensis* (p. 431); *Dufrenoyia* truncata* (p. 436); *Parahoplites* sussexensis* (p. 441). Cheloniceratidae: *Cheloniceras* perli* (p. 445), *C.* crassum* (p. 449). Ancyloceratidae: *Epancyloceras* hythense* (p. 455); *Tonohamites* proteus* (p. 461). There are notes on specimens of *Deshayesites deshayesi; D.* aff. *latilobatus; D. consobrinoides; D. consobrinus*; D. fissicostatus* (Phillips) (=*Hoplitides bodei* v. *tenuicostatus* v. Koenen); *D. bodei*, restricted; *D.* aff. *laeviusculus; Dufrenoyia furcata; D. lurensis*; Parahoplites nutfieldensis*; *P.* aff. *campichei; P. simmsi**, first illustration; *P.* cf. *multicostatus; Procheloniceras* cf. *albrechti-austriae; P.* cf. *pachystephanus; Cheloniceras hambrovi; C.* aff. *gottschei; C.* aff. *meyendorffi; C. cornuelianum; C. kiliani; C.* aff. *seminodosum; C. martini**; *C.* aff. *tschernyschewi; C.* aff. *subnodosocostatum; Ancyloceras matheronianum; A.* aff. *varians; Tropaeum bowerbanki; T. hillsi; T. gigas**; *T.* cf. *gracile; Ammonitoceras tovilense; Tonohamites decurrens;* and *Hamites? grandis**. —*C. H. Crickmay.*

17608. **TEGLAD, NELLIE MAY. The gastropod genus Galeodea in the Oligocene of Washington.** *Univ. California Publ., Bull. Dept. Geol. Sci.* 19(18): 397-434. 7 pl. 1931.—Specimens from the Oligocene and Miocene, hitherto referred to *Eudolium*, are all *Galeodea*. A phylogenetic series is traceable from Up. Eocene through Oligocene horizons to the Miocene spp., maximum development being in Oligocene. *Galeodea tri-tuberculata**, emended descr.; *G.* fax* (p. 410), Lincoln formation (Oligocene); *G.* rex* (p. 413), Blakeley formation (Oligocene); *G.* apta* (p. 415), Twin Rivers formation (Oligocene); and *G.* petrosa* (*Dolium petrosum* Conrad) (p. 418). Types of n. spp. in Univ. of California.

17609. **TORRE, CARLOS de la. New Cuban Urocoptidae.** *Proc. Acad. Nat. Sci. Philadelphia* 81: 443-447. 16 fig. 1929.—*Urocoptis* intusfalcata* Torre & Ramsden (p. 443), *U.* manzanillensis* (p. 444), *U.* nodulifera* (p. 444), *U.* cuestai* (p. 445), *U.* terebella* (p. 445), *U.* rocai* (p. 446), *Microceramus* bermudezi* (p. 446), all from Cuba, types in Acad. Nat. Sci., Philadelphia.

17610. **WAGNER, HANS. Diagnosen neuer Limaciden aus dem Naturhistorischen Museum in Wien.** *Zool. Anz.* 95(5/8): 194-202. 1931.—*Limax* (*L.*) scupicus (p. 194), Jugoslavia; *Lehmannia* (*L.*) *marginata* v. multilineata (p. 195) [locality not given]; *Agriolimax* steindachneri (p. 196), Turkey; *A.* brunneri (p. 197), Bulgaria; *A.* lăbămi (p. 198), Sardinia; *A.* rivanus (p. 199), Italy; *Milax* (*M.*) kusceri (p. 200), Jugoslavia; *M.* (*Subamalia*) scyrius (p. 201), Skyros, Greece; *M.* (*S.*) athenensis (p. 201), Greece.

17611. **YOKOYAMA, MATAJIRO. Pliocene shells from near Nanao, Noto.** *Imp. Geol. Surv. Japan Rept.* No. 104. 1-7. 6 pl. 1929.—*Pecten* (*Patinopecten?*) *kagamianus** Yok. (=*Pecten permirus* Yok.) redescribed; *P. notoensis** redescr.; *P.* (*Chlamys*) *hastatus* v. ingeniosa* (p. 5); *P.* (*C.*) crassivenius* (p. 6); *P.* sp.* Types in Geol. Mus. Imp. Univ. Tokyo.

17612. **YOKOYAMA, MATAJIRO. Pliocene shells from Tônohama, Tosa.** *Imp. Geol. Surv. Japan Rept.* 104. 9-17. 2 pl. 1929.—A report on 46 spp. of which the most important are: *Comus comatosaeformis**, new to Japan; *Pleurotoma carinata* v. *woodwardi**, new to Japan; *Fusus dualis**, emendation; *Dolium costatum**, descr. notes (this species is still living in central Japan and the Philippines); *Rostellaria fusus**, *Subemarginula cicatrosa**; *Dentalium* (*Fustiaria*) suzukii* (p. 14); *Corbula* tosana* (p. 15), *Crassatellites yagurai** Makiyama (=*C. oinouyei* Yok.); *Thracia pubescens**, *Arca philippiana**, and *Cucullaea concamerata**. Types of new spp. in Geol. Coll. Imp. Univ. Tokyo.

CRUSTACEA

CHANCEY JUDAY, H. A. PILSBRY, CLARENCE R. SHOEMAKER,
CHARLES B. WILSON, *Assistant Editors*

(See also in this issue Entries 15683, 15705, 15730, 16021, 16592, 16703, 17268, 17280, 17284, 17486, 17519, 18112, 18114, 18115)

17613. **BALDI, EDGARDO.** Il diaptomide trasimenico. Contributo al problema delle razze del vulgaris in Italia. [German summary.] *Internat. Rev. Ges. Hydrobiol. u. Hydrograph.* 25(3/4) : 219-256. 13 fig. 1931.—On the races of *Diaptomus vulgaris** in Italy.

17614. **BLAKE, CHARLES H.** Two freshwater ostracods from North America. *Bull. Mus. Comp. Zool. Harvard Coll.* 72(7) : 281-292. 26 fig. 1931.—*Cyprinotus*, key to N. Amer. spp.; *C.* sulphureus* (p. 281), Utah; *Heterocypris* does not seem to warrant generic rank; *Cypriconcha* macra* (*Cypris grandis* Chambers, preocc.) (p. 288).

17615. **BRONSTEIN, Z. S.** Beiträge zur Kenntnis der Ostracodenfauna U. S. S. R. und Persiens. *Arch. Naturgesch. Abt. A* 91(9) : 1-30. 2 pl., 4 fig. 1925(1927).—Notes on materials collected in various sections, with the following new data: *Cyclocypris serena* ssp. brevisetosa* (p. 2), Vologodsk Province; *Cypridopsis elongata* v. orientalis* (p. 8), Moscow Prov.; *Eucypris inflata** redescribed; *E. clavata* v. parva* (p. 16) and *Potamocypris almasyi* v. angulata* (p. 17), Kuban Prov.; *Ilyocypris gibba*, description of ♂; descriptive remarks on *Cypris pubera* and *C. bispinosa*; *C.* maculosa* (p. 22), *Strandesia vavrai* v. persica* (p. 24) and *Herpetocypris* tarnogradsky* (p. 25), Persia; 10 spp. of Ostracoda are now known from Persia. The bibliography contains 42 references. Types in Zool. Mus. Moscow.

17616. **CANNON, H. GRAHAM.** Nebaliacea. *Discovery Repts. (Government Dependencies Falkland Isls.)* 3: 199-222. 1 pl., 7 fig. 1931.—Descriptive studies of *Nebaliopsis typica**, *Nebaliella extrema**, and *Nebalia longicornis*.

17617. **DOLLFUS, R.-PH.** Addendum à ma note sur le Sarcotaces verrucosus Olsson. *Bull. Mus. Nation. Hist. Nat.* 1(3) : 191-192. 1929.

17618. **ELSTER, H.-J.** Über einen Fundort von Diaptomus superbus Schmeil, nebst einigen Bemerkungen über die Farben der Copepoden. *Zool. Anz.* 96(9/10) : 245-251. 2 fig. 1931.—Ecological notes on *Diaptomus superbus, D. castor, Heterocope weismanni, H. saliens*, and *Chirocephalus grubei*, and the effect of temp. and other factors on color.

17619. **FLIPSE, H. J.** Einige Parthenopidae aus dem naturhistorischen Museum in Leiden. *Zool. Mededeel.* 14(1/2) : 89-96. 1931.—Notes on 10 spp. of *Lambrus* and 2 of *Parthenope* with full descriptions of *L.* (*Platylambrus*) *prensor* (Herbst), *L.* (*Pseudolambrus*) *beaumonti* (Alcock) and *Parthenope spinosissima* A. Milne Edwards.—*M. J. Rathbun.*

17620. **GLAESSNER, MARTIN F., and THOMAS H. WITHERS.** On London clay [Eocene] crabs of the family Raninidae. *Ann. and Mag. Nat. Hist.* 8(47) : 484-493. 2 pl., 1 fig. 1931.—*Laeviranina* glabra* (*Palaeocorystes g.* H. Woodward) (p. 485) and *L.* gottschei* (*Raninellopsis g.* J. Böhm) (p. 486) are redescribed and compared with other spp., and their systematic position is discussed. *L.* vaderensis (*Raninoides v.* Rathbun) (p. 491); *L.* lewisana (*R. lewisanus* Rathbun) (p. 491); *L.* washburnei (*R. w.* Rathbun) (p. 491); *L.* dickersoni (*R. d.* Rathbun) (p. 491).

17621. **[GUR'ĬANOVA, E.]** ГУРЬЯНОВА, Е. К фауне Crustacea-Malacostraca Баренцова, Белого и Карского морей. **[Crustacea-Malacostraca of the Barents, White, and Kara Seas.]** [English summary.] Труды Ленинградского Общества Естествоиспытателей. Протоколы заседаний, научные статьи и сообщения (*Trav. Soc. Natur. Léningrad, Compt. Rend. Séanc.*) 59(1) : 29-46. 7 fig. 1929.—An annotated list of the more interesting Isopoda, Amphipoda, and Decapoda found, including some forms new to the region.

17622. **HART, T. J.** Preliminary notes on the bionomics of the amphipod, Corophium volutator Pallas. *Jour. Marine Biol. Assoc. Unit. Kingdom* 16(3) : 761-789. 4 fig. 1930.—Collections of the estuarine amphipod *C. volutator* were made from widely separated localities, and, together with observations on living animals, showed that it can withstand great changes in salinity, but that its abundant occurrence is limited by the nature of the substratum. Coarse grey mud with little decaying matter and a pH well on the alkaline side, is required. The species is mainly a selective deposit feeder. Small particles of detritus are sifted out by the setae fringing the first gnathopods when the animal is crawling freely over the surface of the mud, and transferred to the mandibles by the maxillipeds. Within the burrow a method of suspension feeding is employed. Measurements and examination of the ♀♀ showed that the breeding period lasts from April to Sept., and several broods are hatched each yr. The last hatched broods mature slowly through the winter and begin breeding the following spring. During autumn and winter the mature individuals of the previous season die off. The morphology of the gut diverticula suggests that *Corophium* is a secondarily modified amphipod, probably derived as an early offshoot from the evolutional series which started from gammaridean stock and culminated in the degraded caprellids. A previously described variation has been attributed to the effect of the adoption of a less saline habitat. The Whitby collections do not bear this out, and suggest rather that it is in some way correlated with the higher rate of metabolism of the "summer stock." These reach maturity in about 2 mos., while the winter stock take 6. The proportion of variants is much higher in the summer stock.—*T. J. Hart.*

17623. **HESSE, ERICH.** Färbungsabweichungen bei Chirocephalus grubii Dyb. *Zool. Anz.* 96(1/2) : 38-40. 1931.—In Mark Brandenburg, albinotic phases occur, localized in certain pools and ditches. While chemical composition is a factor capable of influencing color, it seems that this particular color deviation is due chiefly to other factors. The albinotic phases persist in a given locality for upward of 6 years.

17624. **KIEFER, FRIEDRICH.** Neuseeländische Süsswassercopepoden. *Zool. Anz.* 96(11/12) : 273-282. 11 fig. 1931.—A report of the copepods found at 8 localities in New Zealand, and a description of *Gladioferens* gracilis* (p. 275); notes on *Eucyclops* (*Tropocyclops*) *prasinus*.

17625. **LEBOUR, MARIE V.** The larvae of the plymouth Galatheidae I. Munida banffica, Galathea strigosa and Galathea dispersa. *Jour. Marine Biol. Assoc. Unit. Kingdom* 17(1) : 175-187. 3 pl., 1 fig. 1930.—The larvae of these 3 species are described and figured, all having been hatched from the egg. The 2 genera *Munida* and *Galathea* are compared in their larval forms and the 3 species differentiated.—*M. V. Lebour.*

17626. **LOWNDES, A. G.** Some fresh-water Entomostraca of the Birmingham district [England]. *Ann. and Mag. Nat. Hist.* 8(48) : 561-577. 9 fig. 1931.—A list of 33 spp. of Copepoda, 38 Cladocera, and 28 Ostracoda, with general remarks. Ostracoda: descriptive data on *Candona neglecta**; *Cryptocandona vàvrai* and *Herpetocypris intermedia*, new to British Isles; *Ilyocypris* ambigua (p. 569). The spp. are listed according to localities.

17627. **MAKI, MOICHIRO.** On Pinnotheres parvulus, Stimpson. [In Japanese.] *Trans. Nat. Hist. Soc. Formosa* 21(116): 280-281. 1 fig. 1931.

17628. **MARKEWITSCH, A. P.** Parasitische Copepoden und Branchiuren des Aralsees, nebst systematischen Bemerkungen über die Gattung Ergasilus Nordmann. *Zool. Anz.* 96(5/6): 121-143. 8 fig. 1931.—Report of finding *Lamproglena pulchella* parasitic in *Scardinius erythrophthalmus; Ergasilus sieboldi** in 15 spp. of fishes; *Caligus lacustris* in 10 spp.; *Lernaeocera esocina* in *Cyprinus carpio* and *Esox lucius; Argulus foliaceus* in 9 spp. The genus *Ergasilus* is considered critically, with tables of measurements of the characters of 4 spp.

17629. **MARSH, C. DWIGHT.** On a collection of Copepoda made in El Salvador by Samuel F. Hildebrand and Fred J. Foster of the U. S. Bureau of Fisheries. *Jour. Washington Acad. Sci.* 21(10): 207-209. 1931.—Annotated list of 3 spp.

17630. **OAKLEY, C. L.** The Chondracanthidae (Crustacea: Copepoda); with a description of five new genera and one new species. *Parasitology* 22(2): 182-201. 8 fig. 1930.—The Chondracanthidae have been already divided by Leigh-Sharpe and Oakley into Chondracanthinae and Lernentominae, and the paper completes the account of the family by dealing with the former subfamily. A survey of the history, ecology, and morphology is given, and a discussion of the systematic position. Two new group names are proposed, the **CYCLOPIFORMES** (p. 185) and the **CALIGIFORMES** (p. 185). The former includes free-swimming forms and also Ergasilidae, Juanettiidae, Chondracanthidae, and Monstrillidae; the latter the Caligidae, Dichelesthiidae, Lernaeidae, Lernaeopodidae, Choniostomatidae and Herpyllobiidae. The Chondracanthinae include the following genera: *Chondracanthus* Delaroche (with 12 spp.), *C. zei** Delaroche; *C. lophii** Johnston; *C. merluccii** (Holten); *Acanthochondria* Oakley, 1927; *A. cornuta** (O. F. Müller); *A. clavata** (Bassett-Smith); *A. depressa** (T. Scott); *A. epachthes* (Wilson); *A. flurae** (Kröyer); *A. limandae** (Kröyer), *A.* **purpurea*** (p. 193), parasitic on *Eleginops maclovinus* from Falkland Isls.; *A. soleae* (Kröyer); **ACANTHOCHONDRITES** (p. 195), erected to include *A.* **annulatus*** (*Chondracanthus a.* Olsson) (p. 195); **CHONDRACANTHOPSIS** Wilson MS. (p. 196), type *C.* **nodosus*** (*Chondracanthus n.* Müller) (p. 196); **DISPHAEROCEPHALUS** (p. 196), erected to include *D.* **ornatus*** (*Chondracanthus o.* T. Scott) (p. 196); *Blias* Kröyer, type *B. prionoti* Kr.; **CHONDRACANTHODES** Wilson MS. (p. 199), type *C.* **deflexus** (p. 199) *Diocus* Kröyer, type *D. gobinus* (Müller); *Pseudochondracanthus*, Wilson, type *P. diceraus* Wilson; **TRIPHYLLACANTHUS** (p. 200), for *T.* **molestus** (Heller) new comb.—*R. Gurney.*

In his introductory remarks and historical review the author says: "An attempt has been made here to separate the genus *Chondracanthus* into its component genera, and for that purpose 5 new genera have been erected: *Acanthochondria* Oakley 1927, **ACANTHOCHONDRITES; CHONDRACANTHODES, CHONDRACANTHOPSIS,** and **DISPHAEROCEPHALUS.** The descriptions of Chondracanthodes and Chondracanthopsis were communicated to me in manuscript by Wilson."

17631. **QUEEN, JOHN.** Additional Brachyura and crab-like Anomura from Friday Harbor, Washington. *Publ. Puget Sound Biol. Sta.* 7: 393-400. 7 fig. 1930.—*Cryptolithodes sitchensis* Brandt, *Lopholithodes foraminatus* (Stimpson), *Munida quadrispina* Benedict, *Pugettia richii* Dana, and *Chionoecetes tanneri* Rathbun are reported, described, and figured.—*M. W. Smith.*

17632. **ROY, JEAN.** Mission saharienne Augiéras-Draper, 1927-1928. Copépodes et ostracodes. *Bull. Mus. Nation. Hist. Nat.* 1(6): 392-393. 1 fig. 1929.—Brief notes on 4 spp. of Copepoda, *Eucyclops nubicus**, and 1 sp. of Ostracoda.

17633. **STEPHENSEN, K.** On Lepidepecreella cymba (Goës), a gammarid amphipod from Spitzbergen. *Arkiv. Zool.* [*Stockholm*] 22A(2 No. 9): 1-6. 2 fig. 1931.—A redescription, with figures, of the type specimen (♀) of *Lysianassa cymba* Goës, from the Storfjord, in 10 m., clay. Type in Naturhist. Riksmuseum, Stockholm. The species is transferred to the genus *Lepidepecreella* Schellenberg, with which the genus *Paracyclocaris* Barnard, is also synonymous, according to the author. *Lepidepecreela* now includes 3 species: *L.* **cymba*** (*Lysianassa c.* Goës) (p. 1), *L. ctenophora* Schellenberg, and *L.* **bidens** (*Paracyclocaris b.* Barnard) (p. 6). It affords a new case of bipolarity among the genera of Amphipoda.—*W. M. Tattersall.*

17634. **TATTERSALL, W. M.** A terrestrial amphipod new to the fauna of Lancashire and Cheshire. *North Western Naturalist* 6(4): 224-225. 1931.—On *Talitrus alluaudi.*

17635. **WHITCOMB, LAWRENCE.** New information on Homalonotus trentonensis. *Bull. Geol. Soc. America* (*Proc. Paleontol. Soc.*) 41(2): 341-350. 2 pl. 1930.—Additional parts of this trilobite, never found before, were collected from the lower Trenton (Salona formation) Salona, Clinton Co., Pennsylvania. This has made possible a more complete description than has hitherto been published. *H. trentonensis** is particularly interesting because it is the oldest homalonotid known in N. America. The genus is placed in the subgenus *Brongniartella*. The history of the species is reviewed and a comparison made with the nearest related forms. *H. trentonensis* has been found only throughout the Trenton horizons of central Pennsylvania. It is most closely related to *H. bisulcatus* from the Up. Longville and Marshbrook beds in Wales. The 2 species are probably of about the same geologic age.—*G. A. Stewart.*

(=*C. macleayi* Andr.); *Anisodactylus karennius* Bates (=*Harpalus* (?) *k.* Bates); *Harpalus salinus* Dej. (=*Hypsinephus ellipticus* Bates); *Hypolithus acutangulus* Bates is probably identical with *H. javanus* Gory; *Trigonotoma verberifera* Schauf. (=*T. modesta* Heyne); *Dicranoncus pocillator* Bates (=*Monacanthonyx p.* Bates); *Dinopelma bouchardi* Pllde. (=*Hexagonia b.* Pllde.); *D. virens* Andr. (=*Hexagonia v.* Andr.); *Lachnothorax tokkia* Gestro (=*L. malayicus* Andr.); *Planetes ruficollis* Nietn. (=*P. immaculatus* Schaum).

17637. **BALTHASAR, VLADIMÍR.** Pseudopachydema caucasica nova species novi generis Pachydeminorum. (5. Beitrag zur Kenntnis der Scarabaeidae des palaearktischen Faunagebietes.) *Ent. Blätter* 26(1): 38-40. 1930.—Key to 7 genera of Pachydemini (Scarabaeidae) including **PSEUDOPACHYDEMA** (p. 39) for *P.* **caucasica** (p. 39), Caucasus.—*M. H. Hatch.*

17638. **BENDERITTER, E.** Rutélides du Congo Belge. *Rev. Zool. et Bot. Africaines* 20(1): 56-58. 1930.—*Anomala* **uvirae** (p. 56), **maculipyga, plurisulcata** (p. 57); *Adoretus maculatus* Bend., emended description.

17639. **BORCHMANN, F.** Ueber die von Herrn J. B. Corporaal in Ost-Sumatra gesammelten Lagriiden, Alleculiden, Meloiden und Othniiden. *Tijdschr. voor Ent.* 72(1): 1-39. 1929.—*Heterogria* **atra** ♀ (p. 7), Borneo; *Cerogria anisocera* v. **corporaali** (p. 8); *C.* **pulchella** ♂ (p. 8), type in author's coll.; **AULONOGRIA** (p. 9), resembling *Lagria*, type *A.* **rugosa** (*Lagria r.* Fairm.) (p. 10); *A.* **corporaali** (p. 11); *A.* **cyanea** (p. 12); *L. lemoides* Fairm., *L. concolor* Blanch., *L. coerulescens* Gyll., and *L. foveifrons* Bm., referred to this genus; *Sora* **opacicollis** (p. 13); *S.* **pulchella** ♂ (p. 14); *S.* **absumata** (p. 15), Java; *S.* **affinis** ♀ (p. 16); *Casn[onidea] atricolor* v. **erythrothorax** ♂ (p. 17), Borneo; *C.* **torridula** (p. 17); *C.* **corporaali** ♀ (p. 18); *C.* **nigra** (p. 19); *C.* **nigrocoerulea** (p. 20); *Borchmannia* **nigrifinis** ♂ (p. 21), Mindanao and Java; *Allecula* **pallipes** (p. 25); *A.* **solida** ♀ (p. 26) and *A.* **nana** (p. 27), in author's coll.; *A.* **caderans** (p. 28); *A.* **pupillicollis** (p. 30), in author's coll.; *Borboresthes* **picta** (p. 31); *B.* **brunnea** ♂ (p. 32); *B.* **pallicornis** ♀ (p. 32); *Asticostena* **basicornis** (p. 33), Java; *Cistelopsis* **marginata** (p. 35), in author's coll.; *C.* **fulva** (p. 35), in Deutsch. Ent. Inst. Dahlem; *Cteniopinus* **melanogaster** (p. 36), in author's coll.; *Cistelomorpha focaleata* v. **melaniventris** (p. 37); *Zonitoschema* **corporaali** (p. 38).

17640. **BRUCH, CARLOS.** Una especie nueva de Prionapterus Guér. (Coleóptero Priónido). *Rev. Soc. Ent. Argentina* 2(5): 203-208. 1 pl., 1 fig. 1929.—*P.* **breyeri*** (p. 205), Puerto Aguirre, Argentina.

17641. **BRUCH, CARLOS.** Histéridos huéspedes de Pheidole. *Rev. Soc. Ent. Argentina* 3(1): 1-12. 1 pl., 5 fig. 1930.—A collection made by Daguerre from ant colonies, about 190 km. south of Buenos Aires, included: **TERATOLISTER** (p. 1), near *Terapus, type T. daguerrei** (p. 4); *Terapus* **rufosetosus*** (p. 5), with *Pheidole cordiceps; Synoditinus herteli** Reichensp., described; new to Argentina, **PARASYNODITES** (p. 8), resembling *Mesynodites*, type *P.* **suturacava*** (p. 9); *Hetaeriosoma* **pheidoliphila*** (p. 10). All except one are myrmecophiles of *Pheidole strobeli* v. *misera* Sants.

17642. **BRUCH, CARLOS.** Coleópteros nuevos y poco conocidos. *Rev. Soc. Ent. Argentina* 3(1): 31-42. 3 pl., 4 fig. 1930.—**SANTIAGONIUS** (p. 31), (tribe Paederini), type *S.* **gomezi*** (p. 33); *Drilocephalus pallidipennis* Pic, discussed; *D.* **iliarensis*** (p. 35); *Terapus* **ogloblini*** (p. 37), (antedated by *T. mirificus* Reichensp., into whose synonymy it falls); **TERMITOLISTER** (p. 39), near *Trichoreninus*, type *T.* **köhleri*** (p. 41), from nest of *Cornitermes similes*. All new spp. from Argentina.

17643. **BURGEON, L.** Deux Craspedophorus africains nouveaux (Coléoptères Carabidae). *Rev. Zool. et Bot. Africaines* 19(2): 295-297. 1930.—*C.* **simplicicollis** (p. 295), Nyasaland, type presumably in Brit. Mus.; *C.* **imperialis** (Kolbe in litt.) (p. 296), Toga and Gold Coast.

17644. **CAMERON, MALCOLM.** New species of Staphylinidae from the Belgian Congo. [Continuation.] *Rev. Zool. et Bot. Africaines* 19(3/4): 405-421. 1930.—*Oxytelus* **simulans** (p. 405); *Astenus* **tricolor** (p. 406); **NOPROMAEA** (p. 406) (Aleocharinae), close to *Pronomaea*, type *N.* **trifida** (p. 407); *Pronomaea* **uelensis** (p. 408); *Gyrophaena* **schoutedeni** (p. 408); *Stenusa* **africana** (p. 408); *Homalota* **dentiventris** (p. 409); key to the spp. of *Demera* (*Dorylophila*); *Demera* (*Dorylophila*) **soror** (p. 410); *D.* (*Dorylophila*) **planipennis** (p. 411); *D.* (*Demerina*) **wasmanni** (p. 411); *D.* (*D.*) **planicollis** (p. 412); *D.* (*D.*) **laticeps** (p. 412); *D.* (*D.*) **longicollis** (p. 413); *D.* (**DEMERILLA**, n. subg.) (p. 413), erected to include *Demera* (*D.*) **rotundiceps** (p. 413); *D.* (*D.*) **falagrioides** (p. 414); and *D.* (*D.*) **germana** (p. 414); *Dorylopora* **abdominalis** (p. 414); *D.* **excisicollis** (p. 415); *D.* (**DORYLOCOSTA**, n. subg.) (p. 416); *D.* (*D.*) **intermedia** (p. 416); *Falagria* (*Anaulacaspis*) **dorylophila** (p. 416); *F.* (*A.*) **semiaspera** (p. 417); *Atheta* (*Acrotona*) **dorylophila** (p. 417); *A.* (*A.*) **urundensis** (p. 418); *A.* (*A.*) **burgeoni** (p. 418); *Astilbus* **dorylophilus** (p. 418), type in author's coll.; *Termitobia* **burgeoni** (p. 419); **TERMOZYRAS** (p. 420), resembling *Termitopaedia*, based on *T.* **politus** (p. 421).

17645. **CAMERON, MALCOLM.** Fauna Sumatrensis. (Bijdrage Nr. 67.) Staphylinidae (Col.). *Tijdschr. voor Ent.* 73(3/4): 325-348. 1930.—The present paper is a continuation from Ent. Mitteil. vol. 17, p. 110, 1928, and contains corrections to be applied to that paper, besides the following: *Apatetica javanica* v. **sumatrana** (p. 326); *Stenus* (s. str.) **brachycephalus** ♀ (p. 327); *S.* (*Hemistenus*) **simulans** (p. 327); *S.* (*H.*) **morosus** ♀ (p. 328); *S.* (*H.*) **singgalangensis** ♀ (p. 328); *S.* (*H.*) **pallidipes** (p. 328); *S.* (*H.*) **jacobsoni** (p. 329); *Edaphus* **mandibularis** (p. 330); *E.* **borneensis** (p. 331); *Pinophilus* **jacobsoni** (p. 331); *Paederus* **atriventris** (p. 332); biological notes by Edw. Jacobson on *P. fuscipes* Curt.; *Astenus* **marginellus** (p. 334), Malay Pen. (type); *A.* **guttalis** (p. 334) and v. **elytra immaculate** (p. 334); *A.* **serpentarius** (p. 335), Malay Pen. (type); *Stilicus* **seriatus** (p. 336), Malay Pen. (type); *Stilicoderus* **strigellus** ♀ (p. 336); *Psilotrachelus* **geniculatus** (p. 337); *Thinocharis* **affinis** (p. 338), Sumatra and Malay Pen. (type); *T.* **alternans** (p. 338); *T.* **sumatrensis** (p. 338); *Medon* **basipilosus** (p. 340); *M.* **vermiculatus** ♀ (p. 340); *M.* **rusticus** ♀ (p. 341); *M.* **singgalangensis** (p. 341); *M.* **leai** (p. 342), Malay Pen. (type); *M.* (*Hypomedon*) **latens** (p. 343); *M.* (*H.*) **inconspicuus** (p. 343); *M.* (*H.*) **terrestris** ♀ (p. 344); *M.* (*Isocheilus*)

magnus (p. 344); *M.* (*Charichirus*) elegans (p. 345); *Scopaeus* jacobsoni (p. 346); *S.* elegantulus (p. 346), Malay Pen. (type); *Pseudobium* (*Dysanabatium*) sumatrensis ♀ (p. 348). All from Sumatra; additional localities noted. Holotypes in Brit. Mus.

17646. **DONISTHORPE, HORACE.** Hydnobius spinipes, Gyll., a species of Coleoptera new to the British list. *Ent. Rec. and Jour. of Variation* 43(2): 33. 1931.

17647. **DONISTHORPE, HORACE.** Spermophagus sericeus Foucr., Ent. Paris, 1 112 (1758), a British insect. *Ent. Record and Jour. of Variation* 43(2): 33-34. 1931.—*S. sericeus* was first recorded as British in 1927, and then only by name. Author here gives a description, based upon comparison with specimens in the general coll. of Coleoptera of the Brit. Mus. The insect is found on the Continent, on *Convolvulus sepium*, etc., and *Crataegus*, and is widely distributed in Central Europe.

17648. **FALL, H. C.** The North American species of Hymenorus (Coleoptera: Alleculidae). *Trans. Amer. Ent. Soc.* 57(2): 161-247. 1931.—*Hymenorus*, key to 100 spp.; *H.* distinctus (p. 179), Mississippi (type), Alabama, and Florida; *H.* molestus ♂ (p. 182), Pennsylvania; *H.* arkansanus ♂ (p. 183), Arkansas; *H.* dubius ♂ (p. 184), Mississippi (type) and Alabama; *H.* caurinus ♂ (p. 185), Brit. Columbia; *H.* ulomoides (p. 187), California; *H.* sinuatus ♀ (p. 187), Brit. Columbia, and var. ebeninus (p. 188), California; *H.* macilentus (p. 188), New Mexico; *H.* atratus ♂ (p. 189), Arizona, type in California Acad. Sci.; *H.* illusus ♂ (p. 192), Alabama; *H.* bitumescens ♂ (p. 194), Arizona; *H.* protibialis (p. 196), California (type) and Arizona; *H.* cassus (p. 197), Lower California; *H.* irritus (p. 199), California (type) and Arizona; *H.* conformis (p. 199), Texas; *H.* vigilax ♂ (p. 200), type in Calif. Acad. Sci. and *H.* papagonis (p. 201), both Arizona; *H.* parvus (p. 203), Lower California; *H.* semirufus (p. 203), Florida; *H.* capensis ♂ (p. 205), Lower California; *H.* jacobinus (p. 206), California; *H.* digressus (p. 206), Arizona; *H.* montivagus (p. 207), California; *H.* inutilis (p. 208), Nevada (type), Utah, New Mexico, and Arizona; *H.* trivialis (p. 210), Lower California; *H.* fuscipennis ♂ (p. 211), Florida; *H. dorsalis* Schwarz (=*H. sabalensis* Blatch.); *H.* caducus (p. 213), Alabama (type) and Florida; *H.* thoracicus (p. 214), California (type) and Arizona; *H.* disparatus (p. 215) and *H.* oblivius (p. 216), Texas; *H.* alienus (p. 217), Arizona; *H.* idoneus ♂ (p. 218), Arizona; *H.* tritus (p. 219) and *H.* incertus ♀ (p. 220), Arizona; *H. punctatissimus* Leconte (=*H. macer* Casey); *H.* tenuistriatus (p. 226), Alabama (type) and North Carolina; *H. tenellus* Casey (=*H. elbertae* Blatch.); *H.* brevis (p. 230) and *H.* rufovalis (p. 230), Arizona; *H. deplanatus* Champ. (=*H. gemellus* Cas.); *H.* simiolus (p. 232), Texas; *H.* exilis (p. 233), Arizona; *H.* facetus ♀ (p. 234), Lower California; *H.* horrescens (p. 235), Texas (type) and New Mexico; *H.* milleporus ♀ (p. 236), Arizona, type in Calif. Acad. Sci.; *H.* nevadensis (p. 236), Nevada; *H.* significans ♂ (p. 237), Texas; *H.* conicicollis ♂ (p. 239), Georgia; *H.* quietus (p. 239), Missouri; *H.* texensis (p. 241), Texas; *H.* heteropygus ♀ (p. 241), Florida; *H.* inopiatus (p. 242), Florida (type) and Georgia; *H.* crinitus ♀ (p. 244) and *H.* liebecki ♂ (p. 245), Arizona; *H.* quadricollis ♂ (p. 246), Texas. Types, unless otherwise stated, in author's coll.

17649. **FRANCK, P.** Beitrag zur Coleopterenfauna von Nauheim. *Ent. Blätter* 26(2): 68-71; (3): 144. 1930.—List of 235 spp.—*M. H. Hatch.*

17650. **HAUSER, G.** Coptolabrus pustulifer var. szechwanensis G. H. (Col. Car.). *Ent. Rundschau* 48 (2): 21-22. 1931.—*C. p.* var. szechwanensis (p. 21), Szechuan, China.

17651. **HEINZE, ERICH.** Bemerkungen über einige afrikanische Criocerinen aus dem Dresdener Zoologischen Museum nebst Beschreibung einer neuen Bradylema und zweier neuen Lemen. *Ent. Blätter* 25(3): 143-148. 1929.—Annotated list of 10 African spp., including *Bradylema* nigrocoeruleipennis (p. 143), Tanganyika; *Hapsidolema dunbrodiensis* f. nigrosuturella (p. 145), Zanzibar; *Lema* rugosifrons (p. 145), Tanganyika; *L.* incomparabilis (p. 146), east Africa (Katona).—*M. H. Hatch.*

17652. **HELLER, K. M.** Faunistische und systematische Notizen über Käfer. *Ent. Blätter* 26(3): 105-107. 1930.—Notes on 33 spp., including description of *Dermatodes caesicollis* ♂; *Mecistocerus* maculicrus (*M. maculipes* Hllr., not Faust) (p. 107); *Ischiopsopha papua* Guér. and *amberbakiana*, referred to *Lomaptera*; *Dyscerus furcutus* Marsh., referred to *Pagiophloeus*; *Aoploninus posticatus* Marsh. (=*Timola posticata* Marsh., *A. biarcuatus* Hllr.); *Nechyrus philippinensis* Hllr. (=*N. destitutus* Hllr.); *Endymia philippinica* Hllr., referred to *Blepiarda*.—*M. H. Hatch.*

17653. **HEYMES, PETER.** Atheta (subg. Pseudohygroecia Bernh.) hubenthali nov. sp. [p. 148]. *Ent. Blätter* 25(3): 148-149. 1929.—*A.* (*P.*) hubenthali, Thüringia, type in Hubenthal coll.—*M. H. Hatch.*

17654. **HORN, WALTHER.** Zwei neue Cicindelinen von Borneo und Celebes. *Ent. Nachrichtenbl.* 5(1): 3-6. 1931.—*Cicindela* (*Thopeutica*) sphaericollis ♂ (p. 3), Celebes; *Therates schaumianus* ssp. flavo-ornata ♂ (p. 5), Borneo.

17655. **HORN, WALTHER.** Sur quelques espèces intéressantes du genre Odontochila appartenantes à la faune de l'Argentine. *Rev. Soc. Ent. Argentina* 2(2): 75-76. 1928.—*O. fulgens* ssp. rutilans (*O. rutilans* Klug,= *O. desmaresti* Cast.) (p. 76).

17656. **HUSTACHE, A.** Nouveaux Curculionides de l'Amérique du Sud. *Rev. Soc. Ent. Argentina* 2(5): 227-232. 1929.—CYRTOBAGOUS (p. 227), near *Ochetina*, type *C.* singularis (p. 228), Matto Grosso; *Neobagous* vulgatus (p. 228), Matto Grosso; *N.* setosus (p. 229), Argentina; BAGOIDELLUS (p. 229), type *B.* vernicatus (p. 230), Matto Grosso; ALLOSCOLYTROPROCTUS (p. 230) (only representative of the Campyloscelidae in South America), type *A.* peruanus (p. 231), Peru. Types in author's coll.

17657. **JEANNEL, R.** Coléoptères nouveaux de la troisième campagne organisée par l'Institut de Spéologie dans les Carpathes méridionales. *Bul. Soc. Ştiinţe Cluj* [*Rumania*] 5(fasc. 4, part 2): 134-141. 24 fig. 1931.—Twenty-two caverns of Oltenia, Rumania were explored. Spp. found include: *Duvalius* (*Duvaliotes*) nannus* (p. 135); *Sophrochaeta* (s. str.) longicornis* (p. 137); *S.* (s. str.) obtusa* ♀ (p. 138); *S.* (s. str.) *subaspera* ssp. arcticollis* (p. 139); *S.* (s. str.) *oltenica* ssp. densepuncta* (p. 140); *Tismanella* winkleriana* (p. 141). Types in author's coll.

17658. **KLEINE, R.** Neue Xylobanus-Arten aus Westafrika nebst Fundnotizen. *Rev. Zool. et Bot. Africaines* 19(2): 172-176. 1 pl. 1930.—*X.* pallidicolor* ♀ (p. 174), Cameroons, type in author's coll.; *X.* ugandanus* (p. 174), Uganda; *X.* camerunus* (p. 175), Cameroons.

17659. **KREKICH-STRASSOLDO, R. H.** Beiträge zur Kenntnis malayischer Anthiciden. *Tijdschr. voor Ent.* 71(1/2): 1-10. 9 fig. 1928; 73(3/4): 251-262. 11 fig. 1930.—*Formicomus* latior* (*F. bangi* v. *latior* Pic) (p. 1); *F.* oedipus* Pic (in litt.) (p. 3) and *F.* praecellens* (p. 4), Sumatra; *F. robustipes* ssp. conterminus (p. 6); *F.* (*Orthauchen*) fossulatus* (p. 7) and *F.* (*O.*) mülleri* (p. 8), Borneo. [Vol. 73:] *F.* (*O.*) rufulus* (p. 251); *F.* (*O.*) funebris* (p. 252); *F.* maturus* (p. 253), Sumatra; *F.* distinguendus* (p. 254); *F.* clemens* (p. 255); *Tomoderus* drescheri (p. 256); *Leptaleus* elaboratus (p. 257), Madoera Isl., Dutch E. Indies; *Anthicus* mollinus* (p. 258); *A.* indutus (p. 260); *A.* pilumnus (p. 261); *A.* insignicollis* (p. 261). All from Java unless otherwise indicated.

17660. **LAIDLAW, W. B. R.** The pine-cone weevil (Pissodes validirostris) in Britain; with a brief comparative account of the genus Pissodes. *Scottish Nat.* 1931(189): 79-84. 1 fig. 1931.—*P. validirostris**, which has only recently been recorded in Britain, attacks cones of Scotch and Austrian pines. Keys are given for the continental and British spp. of the genus.

17661. **LEBEDEV, A. G.** Catops roubali sp. n. *Ent.*

Blätter 26(4): 183-184. 1930.—*C.* (*Lasiocatops*) roubali (p. 183), central Asia.—*M. H. Hatch.*

17662. **LIEBKE, MAX.** Die afrikanischen Arten der Gattung Colliuris Degeer (Col. Car.). *Rev. Zool. et Bot. Africaines* 20(3): 280-301. 19 fig. 1931.—Descriptions of 6 new subgenera of *Colliuris*, with key, and annotated list of spp. (keys included). **LASIOCOLLIURIS** n. subg. (p. 284), type *C.* (*L.*) lunata (p. 294), South Somaliland; **NEOCOLLIURIS** n. subg. (p. 286), type *C.* (*N.*) *laportei* Chaudoir; *C.* (*N.*) flavipennis (p. 295), Tanganyika and Pemba Is.; **EUCOLLIURIS** n. subg. (p. 287), type *C.* (*E.*) *natalensis* Chaud.; *C.* (*E.*) cribrifrons (p. 298), northeast Rhodesia, type in author's coll.; **ARCHICOLLIURIS** n. subg. (p. 291), type *C.* (*A.*) *bimaculata* Kollar; *C.* (*A.*) burgeoni (p. 297), Belgian Congo, type in Belg. Congo Mus.; **ERECTOCOLLIURIS** n. subg. (p. 292), type *C.* (*E.*) *fairmairei** Gestro; **PROTOCOLLIURIS** n. subg. (p. 293), with *C.* (*P.*) *coerulans** Alld.; there are critical notes on *C.* (*Neocolliuris*) *laportei* Chaud. and *C.* (*Eucolliuris*) *olivieri* Buquet, besides general distributional notes.

17663. **MACHULKA, V.** Zwei neue palaearktische Scydmaeniden. *Ent. Nachrichtenbl.* 4(4): 83-84. 1930.—*Scydmoraphes* tarsalis (p. 83) and *Stenichnus* horni (p. 83), Italy.

17664. **MAMITZA, RICHARD.** Drei neue äthiopische Heteroceridae vom Musée du Congo Belge. *Rev. Zool. et Bot. Africaines* 19(3/4): 368-372. 4 fig. 1930.—*Heterocerus* (s. str.) denticulatus* (p. 368), *H.* (*Litorimus*) minusculus* (p. 369), *H.* (s. str.) evanescens* (p. 371), all from Belgian Congo.

17665. **MARCU, O.** Beitrag zur Kenntnis der Stridulationsorgane bei Ipiden. *Zool. Anz.* 92(9/10): 238-242. 4 fig. 1930.—The author describes these organs for a few spp. in *Hylesinus**, *Leperesinus**, and *Pteleobius**. In each case it is an elytro-dorsal stridulating organ, with the pars stridens resembling that of spp. of *Myelophilus*.

17666. **MARCU, O.** Ein neuer Beitrag zur Kenntnis der Stridulationsorgane bei Ipiden. *Zool. Anz.* 94(1/2): 32-37. 4 fig. 1931.—Description of stridulating organs in 12 genera of Ipidae.

17667. **MARELLI, CARLOS A.** Respuesta a dos objeciones sobre la identificación de las especies del género Goniopterus halladas en La Plata. [Reply to two objections on the identification of the spp. of Goniopterus found in La Plata.] *Rev. Soc. Ent. Argentina* 2(5): 277-281. 1929.—One of the spp. attacking eucalyptus is *Goniopterus gibberus* Bsd.; the other, *G. platensis* (Mar.) (=*G. marelli* Uyttenb.).

17668. **MIWA, YUSHIRO. H. Sauter's** Formosa-Ausbeute (Elateridae II). *Wiener Ent. Zeitung* 47(4): 205-208. 1931.—*Neotricophorus* carinicephalus (p. 205); *Agonischius* gracilis (p. 205); *Glyphonyx* arisanus (p. 206); *G.* brunneipennis (p. 206); *G.* kankaui (p. 206); *G.* sauteri (p. 207); *G.* castaneus (p. 207). Key is given to the Formosan *Glyphonyx*.

17669. **MURAYAMA, JŌZŌ.** Révisions des familles des Ipides et des Platypides de Corée. *Jour. Chosen Nat. Hist. Soc.* no. 11. 6-38. Map. 2 pl., 1 fig. 1930.—Previous work on this group in Korea is reviewed. Some of the beetles cause serious damage to the forests. The systematic account of 56 spp. includes local and general distribution, lists of plants attacked, economic status, and notes on taxonomy and life history. Keys to many of the spp. are given. *Scolytus* seulensis* (p. 9), attacking *Prunus yedoensis* and *Pirus anzu*; *Cryphalus* carpinivorus* (p. 14), attacking *Carpinus laxiflora*; *Xyleborus* seiryorensis ♀* (p. 25), attacking *Alnus japonica*; *X. monographus*, new to Korea. *Crossotarsus* koryoensis* (p. 28), attacking *Quercus serrata*, *Q. aliena*, and *Carpinus laxiflora*. New spp. are from Korea; types are in author's coll. Bibliography of 144 titles.

17670. **NEVERMANN, FERD.** Zwei neue Colydiiden aus Costa Rica (Col.). *Ent. Blätter* 26(3): 110-114. 2 fig. 1930.—*Ethelema* costaricensis* (p. 110); key to the 8 known spp. of *Discoloma*, including *D.* pygmaeum* (p. 112).—*M. H. Hatch.*

17671. **OCHS, GEORG.** Über einige neue und bemerkenswerte Gyriniden vorzüglich aus dem Dresdener Museum. *Ent. Blätter* 25(4): 197-200. 1929; 26(1): 14-18. 1930.—Bibliographical, distributional, and descriptive notes on 19 spp. of Gyrinidae including *Macrogyrus aenescens* ssp. abbreviatus (p. 197), Sumba, type in Leidener Mus.; *M. elongatus* ssp. laevis (p. 198), Queensland, type in British Mus.; **CYCLOMIMUS** n. subg. (p. 199) for *M. caledonicus* Fauv.; and **ORECTOMIMUS** n. subg. (p. 15) for *M. paradoxus* Rég.—*M. H. Hatch.*

17672. **ORCHYMONT, A. d'.** Über Hydraena (s. str.) angulosa Mulsant. *Ent. Blätter* 25(3): 140-143. 1 fig. 1929.—Detailed description and figure.—*M. H. Hatch.*

17673. **PIC, M.** Notizen und synonymische Bemerkungen über einige Cerambycidae. *Ent. Blätter* 24(3): 142-143. 1928.—Key to 3 spp. of *rubriola*-group of *Leptura*; *L. kingana* v. sexnotatipennis (p. 143) and septemnotata (p. 143); *Judolia erratica* ab. *volgensis* Plav. (=*J. e.* var. *hungarica* Pic); *Strangalia 12-guttata* ab. *10-guttata* Plav. (=*S. 12-g.* var. *suboliterata* Pic); *Plagionotus lugubris* v. lenkoranus (p. 143), Caucasus; *Rhaphuma manipurensis* v. parvereducta (*R. m.* var. *reducta* Plav., preoc.); *Demonax albomaculatus* v. *unicolor* Plav. (=var. *immaculatus* Pic); *Caloclytus 14-maculatus* v. gahani (p. 143).—*M. H. Hatch.*

17674. **PIC, M.** Nouveaux coléoptères de la République Argentine. *Rev. Soc. Ent. Argentina* 2(1): 49-52. 1928.—*Cryptorhopalum obscuriceps* v. bruchi (p. 49); **MIMOSCAPHOSOMA** (p. 49), n. subg. of *Scaphosoma*, type *S.* [*M.*] bruchi (p. 49); *Catorama* caudata (p. 49) and *C. argentina* v. longesulcata (p. 50), types in coll. Pic; *Dasytes bifurcatus* v. infurcatus (p. 50), type in coll. Bruch; *Attalus* bosqui (p. 50); *Belotus* weiseri (p. 50); *Ptilodactyla* irregularis (p. 51) and *Anaspis* disconotata (p. 51), types in coll. Bruch; *Anisostena* bicoloriceps (p. 51).

17675. **PIC, M.** Divers Coléoptères nouveaux de la République Argentine. *Rev. Soc. Ent. Argentina* 2(2): 99-102. 1928.—*Ptinus* rubricollis (p. 99); *Calymmaderus* argentinus (p. 99); *Emplectus* bruchi ♂ (p. 100); *Anthicus sericans* v. trireductus (p. 100); *A. catamarcanus* v. esteroensis (p. 100); *Nemognatha* weiseri and var. invittata (p. 100); *Stenispa* sulcatifrons (p. 101); ? *Charistena* elongaticeps (p. 101). Types in coll. Bruch.

17676. **PIC, M.** Coléoptères de l'Amérique Méridionale. *Rev. Soc. Ent. Argentina* 2(4): 183-184. 1929.—*Cephalolia* rufipes (p. 183), Brazil; *Allecula* bruchi (p. 183), var. saladosa (p. 184), and *Lygistopterus* griseolineatus (p. 184), Argentina.

17677. **PIC, M.** Nouveaux Coléoptères de diverses familles. *Rev. Soc. Ent. Argentina* 3(1): 43-46. 1930.—*Limnichoderus* breyeri (p. 42); *Scirtes adustus* v. diversenotatus (p. 43); *Belotus* concavicollis (p. 44); *Mordella* bruchi (p. 44); *M.* weiseri (p. 44); *Lobopoda* laterufa (p. 45); *Stenispa* parallela (p. 45); *Octotoma* daguerrei (p. 45). All from Argentina, types in coll. Bruch.

17678. **PIC, M.** Coléoptères nouveaux de la République Argentine. *Rev. Soc. Ent. Argentina* 3(1): 55-56. 1930.—*Ptilodactyla* griseosuturalis ♂ and var. rufescens (p. 55); *Eucinctus* argentinus (p. 55), type in coll. Bruch; *Microscapha* bruchi (p. 56); *Orchesia brasiliensis* v. pallidior (p. 56); *Bruchus* catamarcanus (p. 56), type in coll. Bruch.

17679. **PIC, M.** Scaphididae recueillis au Congo Belge par A. Collart. *Rev. Zool. et Bot. Africaines* 20(1): 87-89. 1930.—*Toxidium* collarti (p. 87); *Antongilium burgeoni* v. semibrunneum (p. 87); *Scaphosoma* rufithorax (p. 87); *S.* subconvexum and ssp. semialutaceum (p. 88); *S. schoutedeni* v. atropygum (p. 88); *S.* vicinum (p. 88); *S.* piceonotatum (p. 89).

17680. **PICARD, F.** Coléoptères: Cerambycidae. *Faune de France* 20: vii+166p. 71 fig. 1929.—The cerambycid fauna of France consists of about 235 spp. The general morphology of adults and larvae is discussed. A table of the tribal characteristics of the larvae (p. 8) distinguishes Lamiini, Prionini, Cerambycini, and Lepturini, and unites Asemini with Spondylini. In the tabl

of tribes of adults (p. 33) the Lepturini are united with the Cerambycini. Habits of the adults, such as copulation and oviposition, are discussed, as well as larval habits, pupation and duration of life cycles. 74 hymenopterous parasites are listed with their hosts. Faunal distribution is also dealt with. Descriptions are given of all spp., with distribution and host plants. Keys to genera, subg., and spp., and illustrations of representatives of most genera are given. *Brachytodes* Planet, a subg. of *Evodinus* Le Conte, is suppressed. *Neomarius gandolphi* Fairm., an Algerian sp., was captured at Nancy. *Pseudopoecilium* Planet, a subg. of *Callidium* F., is suppressed. The bibliography contains 226 references.

17681. PJATNITZKY, G. K. Ein neuer paläarktischer Arvenborkenkäfer aus Ostsibirien, Orthotomicus golovjankoi n. sp. *Ent. Blätter* 26(4): 179-182. 3 fig. 1930.—*O.* golovjankoi* (p. 179) and ab. quadridens (p. 182) on *Pinus korajensis* in eastern Siberia; *O. laricis* F.* and *O. suturalis*.—*M. H. Hatch.*

17682. REICHENSPERGER, A. Neue und bekannte Paussiden aus der Sammlung des Imperial Bureau of Entomology. *Ent. Blätter* 25(3): 129-132. 2 fig. 1929.—Annotated list of 16 spp. from Africa, including *Paussus* serratulus* (p. 130), Nigeria, and *P.* exiguus* (p. 131), Sudan.—*M. H. Hatch.*

17683. REICHENSPERGER, A. Subgenera von Paussus und die Gattung Hylotorus, sowie Beiträge zur Kenntnis afrikanischer und südamerikanischer Myrmekophilen (Pauss. Clavig. Hist.). *Ent. Blätter* 26(2): 71-85. 7 fig. 1930.—Discussion of *Paussus, Bathypaussus,* and *Hylotorus,* with a key to the 3 major divisions of the latter. *Carabidomemnus* hargreavesi* (p. 76), Uganda, type in Imp. Bur. Ent., London; *Paussus bayonii* Gestro and *P. scipio* are distinct species; *P.* suahelinus* (p. 79), east Africa; *Hylotorus* gracilis* (p. 81) and *Xenalluaudia* henningsi* (p. 82), Tanganyika, types in author's coll.; *Coelocraera* orientalis* (p. 83), Tanganyika; METASYNODITES n. subg. (p. 84), type *Mesynodites* (*Metasyndotes*) paschalis* (p. 84), Brazil.—*M. H. Hatch.*

17684. REICHENSPERGER, A. Neue Myrmekophilen nebst einigen Bemerkungen zu Bekannten. (Coleopt.: Pauss. Clavig. Hist.) *Tijdschr. voor Ent.* 70(3/4): 303-311. 4 fig. 1927.—*Paussus* corporaali* (p. 303) on *Pheidole* sp., Dutch E. Indies, type in Soc. "Natura artis Magistra," Amsterdam; *Theocerus* clermonti* (p. 306) on *Crematogaster schencki,* type in author's coll.; *Reninus* bruchi (p. 307) in nest of *Acromyrmex octospinosa* v. *pallida,* Pernambuco, type in author's coll. Notes on *Paussus curtisi* Westw. and some other spp. are given.

17685. REICHENSPERGER, AUGUST. Die Paussiden des belgischen Congogebietes. Supplem. 2. *Rev. Zool. et Bot. Africaines* 19(2): 177-180. 1 fig. 1930.—A supplement to previously published articles, containing brief notes and description of *Paussus* sankuruensis* (p. 178), type in Congo Mus.

17686. ROUBAL, J. Descriptiones duorum Coleopterorum novorum regionis palaearcticae. *Ent. Blätter* 25(4): 192-193. 1929.—Descriptions of *Agrilus kyselyi* Obnbg. and *Laena* lebedevi (p. 193), central Asia, type in author's coll.—*M. H. Hatch.*

17687. RÜSCHKAMP, F. Zur rheinischen Käferfauna V. *Ent. Blätter* 25(3): 150-157. 1929.—Annotated list of 101 spp. from Rhenish Prussia.—*M. H. Hatch.*

17688. RÜSCHKAMP, F. Zur rheinischen Käferfauna VI. *Ent. Blätter* 25(4): 172-180. 1929.—Annotated list of 72 spp. from Rhenish Prussia. Note on *Platypus cylindrus* F. and *P. cylindriformis*.—*M. H. Hatch.*

17689. SCHOLZ, M. F. R. Käfer aus Karlsbad in Böhmen, C. S. R. *Ent. Anzeiger* 11(3): 60-61. 1931.—Author adds about 89 spp. to a previous list, published in 1928.

17690. SICK, FR. Fünfter Beitrag zur Käferfauna Ostholsteins. [Coleoptera of eastern Holstein.] *Ent. Blätter* 26(3): 115-118. 1930.—Annotated list of 51 spp.—*M. H. Hatch.*

Types in author's coll. unless otherwise stated. 9.—*Limonia* (*Dicranomyia*) clavigera ♂ (p. 109), Chile; *L.* (*D.*) trinitatis ♀ (p. 110), Cuba; *Polymera* (*Polymerodes*) catharinae ♂ (p. 111), Santa Catharina, Brazil; *Shannonomyia* myersiana (p. 112), Jamaica; *S.* brevicula ♂ (p. 113), Cuba; *Atarba* (*A.*) bifurcula (p. 114), Brazil; *Aphrophila* carbonaria ♂ (p. 115) and *A.* multidentata ♀ (p. 116), Chile; *Trentepohlia* (*Paramongoma*) cubitalis ♀ (p. 116) and *Teucholabis* (*T.*) catharinensis (p. 117), Brazil; *T.* (*T.*) nigrosignata (p. 118), Cuba; *Gonomyia* (*Progonomyia*) quinqueplagiata ♂ (p. 119), Brazil; *G.* (*Lipophleps*) cubana ♂ (p. 120) and *G.* (*L.*) sandersi ♂ (p. 121), Cuba.

17700. **ALEXANDER, CHARLES P. New or little-known Tipulidae from the Philippines (Diptera), VIII.** *Philippine Jour. Sci.* 45(2): 263-296. 3 pl. 1931.—Studies of collections in central and northern Luzon are reported. A list of the generic and subgeneric Tipulidae groups known to occur in the Philippines is given, in which is indicated, for the first time, the occurrence of the following: *Limonia*, subgenera *Discobola* O. S., *Rhipidia* Meig., and *Doaneomyia* Alex.; *Pilaria* Sint.; *Limnophila*, subgenera *Ephelia* Schin. and *Dicranophragma* O. S.; and *Adelphomyia* Bergr. Some of these are discussed in the text. Novelties are: *Tipulodina* pampangensis ♀* (p. 265); *Scamboneura* O. S., key to the 11 Philippine spp.; *S.* subtransversa* (p. 267); *S.* primogenia* (p. 269); *S.* banahaoensis* (p. 270); first description of ♂ *S.* plumbea* Alex. taken at alt. of 8000 ft.; *Dolichopeza* (*Nesopeza*) haightensis ♂ (p. 272), alt. 8000 ft.; *Macgregoromyia* Alex., emended diagnosis with key to its 2 known spp.; *M.* brevisector* (p. 273), alt. 8000 ft.; *Limonia* (*Limonia*) ligayai* (p. 275), alt. 1500 to 8000 ft.; *L.* (*Libnotes*) neofamiliaris ♂* (p. 276); *L.* (*L.*) subfamiliaris ♂* (p. 277); *L.* (*L.*) perparvula ♂* (p. 278); *L.* (*L.*) elata ♂* (p. 279); *L.* (*Dicranomyia*) benguetensis ♂* (p. 280); *L.* (*Geranomyia*) bifidaria* (p. 281), alt. 8000 ft.; *L.* (*G.*) pleuropalloris* (p. 282); *L.* (*Doaneomyia*) pampangensis* (p. 283); *L. p.* subsp. maquilingia* (p. 284); *L.* (*Thrypticomyia*) octosetosa* (p. 284); *Helius* (*Eurhamphidia*) diacanthus* (p. 285), alt. 8000 ft.; *Adelphomyia* luzonensis ♀* (p. 286); *Epiphragma* subcrenulata ♀* (p. 287); *E.* cinereinota ♀* (p. 288), alt. about 8000 ft.; *Limnophila* (*Limnophila*) benguetana ♂* (p. 289), alt. about 8000 ft.; *L.* (*Dicranophragma*) pardalota ♀* (p. 291); *Toxorhina* (*Toxorhina*) montina* (p. 292); *T.* (*T.*) biceps ♂* (p. 292); and *Erioptera* (*Erioptera*) rubripes ♀* (p. 293). Types in author's coll.

17701. **BARNES, H. F. Gall midges (Cecidomyidae) whose larvae prevent seed production in grasses. (Gramineae).** *Bull. Ent. Res.* [*London*] 22(2): 199-203. 1931.—A list of 18 spp. in the genera *Lasioptera, Dasyneura, Contarinia, Stenodiplosis, Cecidomyia,* and *Itonida,* is given.

17702. **BARNES, H. F. A new predacious gall midge (Dipt., Cecidomyidae).** *Bull. Ent. Res.* [*London*] 22(2): 205-207. 2 fig. 1931.—TRIOMMATA (p. 205), near *Trisopsis,* type *T.* coccotroctes* (p. 206), Sierra Leone, predacious on mealy bug; types in Imp. Inst. Ent.

17703. **BEDFORD, H. W. The distribution of tsetse-flies in the Sudan.** *Bull. Ent. Res.* [*London*] 21(3): 413-415. 5 maps. 1930.—Notes on a new locality for *Glossina palpalis fuscipes,* a suspected region for *G. morsitans,* and the known distribution of tsetse-flies in the Sudan.

17704. **BROMLEY, S. W. New neotropical Andrenosoma.** *Trans. Amer. Ent. Soc.* 57(1): 129-134. 1931.—The author gives an emended diagnosis of *Andrenosoma* Rondani, and refers to this genus the Laphriinae hitherto placed in *Nusa* by American writers; *A.* minos ♂ (p. 130), Brazil and Ecuador; *A.* lupus ♂ (p. 130), Brazil; *A.* heros (p. 131), Dutch Guiana, *A.* subheros (p. 131), Brazil, and *A.* nigrum ♀ (p. 132), Ecuador, types in Hamburg Mus.; *A.* rufum ♂ (p. 132), Santo Domingo; *A.* batesi ♂ (p. 132), Brazil; *A.* currani ♂ (p. 133), Brazil, type in Hamburg Mus.; *A.* flamipennis (p. 133), British Guiana (type), Venezuela, and Brazil, type in Acad. Nat. Sci. Philadelphia. Unless otherwise stated, types are in British Mus.

17705. **BROOKE, WINIFRED M. A. Some observations on the life-history of Arthrocnodax wissmani Kieffer (Cecidomyidae: Diptera).** *Entomologist* [*London*] 64 (819): 180-182. 1 pl. 1931.—*A. wissmani* was found feeding on mites, *Phyllocoptes schlechtendali,* on the under side of apple leaves in England. The egg*, larval stages*, cocoon*, pupa*, and adult* are described.

17706. **COPELLO, ANDRÉS. Biología de Hermetia illuscens Latr. (La mosca de nuestras colmenas.) [Biology of H. illuscens, the fly of our beehives.]** *Rev. Soc. Ent. Argentina* 1(2): 23-26. 1 pl., 1 fig. 1926.—Descriptions of egg*, larva*, nymph, and imago*. The insect frequently lays its eggs in cracks on the front of beehives.

17707. **CRESSON, EZRA T. Jr. Notes on and descriptions of some Neotropical Neriidae and Micropezidae (Diptera).** *Trans. Amer. Ent. Soc.* 56(4): 307-362. 2 fig. 1930.—This paper is based on a study of 1115 specimens, representing 10 genera and 91 spp., from Panama, the West Indies, and South America. The following are described: *Odontoloxozus* longicornis (*Nerius l.* Coqu.,=*O. punctulatus* Enderl.) (p. 313); *Nerius* F. (=*Brachantichir* Enderl.,=*Cerantichir* End.); the name Taeniapterinae is adopted for the subfam. of Micropezidae called Calobatinae by Enderlein, and Tanypodinae by Frey, and its characteristics are given; *Rainieria,* characters discussed; *R.* baracoa (*Systellapha b.* Cresson) (p. 318); *R.* nebulosa (*Calobata n.* Loew) (p. 318); *R.* bracteata (*Calobata b.* v. d. Wulp) (p. 319); *R.* tritaeniolata (*Tanypoda t.* Enderl.) (p. 319); *R.* uda (p. 320), Honduras; *R.* pleuralis ♀ (p. 321), Colombia; *Systellapha* placida (*Calobata p.* Loew) (p. 323); *Cliobata* guttulipennis (*Scipopus g.* Enderl.) (p. 324); MITROMYIA (p. 329), (Micropezidae) allied to *Rainieria,* with *M.* conifer (p. 329), Costa Rica, type in U. S. Nat. Mus.; *Cardiacephala* triluminata (*Musca longipes* Fabr., not Scopoli) (p. 330); *Plocoscelus* myrmex (*Cardiacephala m.* Schiner) (p. 332); *P.* harenosus (p. 333), Colombia; *P.* schildi (p. 334), Peru, type in U. S. Nat. Mus.; *P.* modestus ♀ (p. 334), Guatemala; *P.* picinus ♀ (p. 334), Panama, type in Mus. Comp. Zool., Cambridge; *P.* townsendi (p. 335), Peru, type in U. S. Nat. Mus.; *P.* nigra (*Cardiacephala n.* Schiner) (p. 335); *Parasphen-*

frontalis (p. 336), Brit. Guiana, type in N. Y. Zool. Soc.; *Grallomyia* bonitoensis (p. 339), Brazil, type in U. S. Nat. Mus.; *G.* scutellata (p. 341) and *G.* buscki ♀ (p. 342), Panama, types in U. S. Nat. Mus.; *G.* ichneumonea (*Calobata i.* Brauer) (p. 344); *G.* lauta (p. 345), Panama, type in U. S. Nat. Mus.; *Ptilosphen* enderleini (p. 346), Peru, type in Cornell Univ., Ithaca; *P.* comis (p. 347), Brit. Guiana; *P.* mimicus (p. 348), Peru, type in U. S. Nat. Mus. *P.* gentilis (p. 348), Costa Rica, type in U. S. Nat. Mus.; *Taeniaptera lasciva* v. obliterata (p. 351), Ecuador, type in U. S. Nat. Mus.; *T.* angulata (*Calobata a.* Loew) (p. 351); *T.* munda (*Calobata m.* van der Wulp) (p. 352); *T.* platycnema (*Calobata p.* Loew), (p. 352); *T.* planitibia (*Grallomyia p.* Enderl.) (p. 353); TENTHES (p. 354), (Micropezidae) near *Taeniaptera*, with *T.* citatus ♀ (p. 355), Peru, type in Cornell Univ.; *Micropeza* ventralis (p. 356), Mexico, type in U. S. Nat. Mus.; *M.* verticalis (p. 357), Cuba, type in U. S. Nat. Mus.; *Metapobrachia* recta (*Micropeza r.* Cresson) (p. 360); *M.* subrecta (*Micropeza s.* Cresson) (p. 360); and *M.* sagittifer (*Micropeza s.* Cresson) (p. 360); *Cryogonus* formicarius (*Micropeza formicaria* Rondani, = *Cryogonus reedi* Cresson) (p. 362). Types are in Acad. Nat. Sci., Philadelphia, unless otherwise stated.

17708. **CURRAN, C. H.** New Diptera from North and Central America. *Amer. Mus. Novitates* No. 415. pp. 1-16. 1 fig. 1930.—Bombyliidae: key to spp. of the group genus *Exoprosopa* Macq. is given (with division into 3 groups), the following being new: *E.* clarki ♂ (p. 4), 6500 ft. alt., and *E.* lutzi ♂ (p. 5), Arizona; *E.* dodrina (p. 5), Colorado; *E.* texana ♂ (p. 6), Texas; *E.* mus ♂ (p. 7), Mexico; *E.* albifrons ♂ (p. 8), Arizona, 6500 ft. alt.; *E.* panamensis (p. 9), Panama; *E.* junta ♀ (p. 9), Colorado, 4100 ft. alt. All belong in group 2. Asilidae: *Cophura* pollinosa (p. 10), Arizona, alt. 4050 ft.; CEROTAINIOPS (p. 11), between *Cerotainia* and *Atomosia*, type *C.* rufiventris ♀* (p. 11), Arizona, alt. 3500 ft. *Mallophora*, table of spp., including: *M.* fautricoides ♂ (p. 13), California; *M.* bromleyi (p. 13). Syrphidae: *Syrphus* catalina ♀ (p. 14), Arizona; *Callostigma* hyalipennis ♀ (p. 15), Honduras; *Lycastrirhyncha* mexicana ♀ (p. 15), Mexico. Types in Amer. Mus. Nat. Hist.

17709. **CURRAN, C. H.** First supplement to the "Diptera of Porto Rico and the Virgin Islands." *Amer. Mus. Novitates* No. 456. 1-23. 4 fig. 1931.—Stratiomyidae (2): NEUROTA (p. 2), near *Aochletus*, type *N.* bicolor (*Sargus b.* Wiedem.) (p. 2). Tabanidae (6): A review of the spp. occurring in the islands, with keys to genera and to the spp. of *Tabanus*, including *T. stigma* Fab. (= *T. completus* Walk.), *T.* nervosus ♀* (p. 4), and *T. parvulus* Will. Bombyliidae (5): Key to genera known from the islands, and to the spp. of *Diplocampta*, including *D.* roederi* (p. 8). Asilidae: Key to the spp. of *Erax* known from Porto Rico, including *E. stylatus* Fab. (= *E. rufitibia* Macq.), and *E.* forbesi* (p. 10). Dolichopidae (1). Chloropidae (4), including *Oscinella* forbesi (p. 12). Asteiidae (1): Key to the 3 American genera and to the spp. of *Sigaloessa*, including *S.* insularis ♀ (p. 13). Ochthiphilidae (1). Milichiidae (1). Trypaneidae (5): Key to the genera known from region and to spp. of *Dyseuaresta* and *Plagiotoma*, including *P.* pura ♂ (p. 16). Ortalidae (4): Key to genera; *Euxesta* mitis ♀* (p. 17). Sapromyzidae (5): Keys to spp. of *Minettia* and *Pseudogriphoneura*, including *P.* vittifacies (p. 20). Micropezidae (4): Key to genera known from the Islands. Clusiidae (1). Sarcophagidae (2). Tachinidae (4), including *Epigrimyia* towsendi ♀ (p. 22). Types in Amer. Mus. Nat. Hist.

17710. **CURRAN, C. H.** Review of the species of Hoplacephala, Macquart (Sarcophagidae, Diptera). *Ann. and Mag. Nat. Hist.* 2(11): 417-427. 1928.—The synonymy of the genus is given, with one key for separation of the genera and subgenera, and one for the spp. *H.* lateralis ♂ (p. 422), Kenya Colony, and *H.* stannusi ♂ (p. 425), Nyasaland, types in Brit. Mus.; *H.* irvingi (p. 425), Cape Province, type in Munroe coll.

17711. **De MEILLON, BOTHA.** Notes on the larvae of some South African anophelines. *Bull. Ent. Res.* [*London*] 22(2): 237-243. 7 fig. 1931.—Studies on the larvae of *Anopheles natalensis**, *A. ardensis**, *A. gambiae**, *A. squamosus**, *A. cinereus**, *A. argenteolobatus**, *A. theileri**, and a variety* of the last.

17712. **EDWARDS, F. W.** Some suggestions on the classification of the genus Tipula (Diptera, Tipulidae). *Ann. and Mag. Nat. Hist.* 8(43): 73-82. 1931.—The writer uses the following diagnostic characters for the spp. of *Tipula:* length of radial sector, shape of discal cell, presence or absence of Macrotrichia on veins at tip of wing, presence or absence of hairs on the squama, number of tibial spurs, pubescence of thorax, and verticillate hairs of antennae. All generic names referred to *Tipula* are discussed. *Tipula* L., type *T. oleracea* L.; *Pterelachisus* Rond., type *P. bertei* Rond., is a subg. of *Tipula; Anomaloptera* Lioy, type *A. nigra* (L.), is made a subg. of *Tipula; Oreomyza* Pok., type *O. glacialis* Pok. should include the *varipennis-* and *marmorata*-groups, but belongs essentially to *Tipula* s. str.; *Tipulodina* End., type *T. magnicornis* End., is reduced to subgeneric rank under *Tipula; Trichotipula* Alex., type *T. oropezoides* Alex., is probably a valid subg. of *Tipula; Cinctotipula* Alex., type *C. algonquin* Alex., is sunk as a synonym of subg. *Trichotipula; Brithura* Edw., type *imperfecta* Brun. (= *B. conifrons* Edw.), is reduced to subgeneric rank under *Tipula; Nippotipula* Mats., type *N. nubifera* Coq., becomes a subg. of *Tipula; Formotipula* Mats., type *F. holoserica* Mats., is made a subg. of *Tipula; Yamatotipula* Mats., type *T. nova* Walk. (= *Y. nohirae* Mats.), provisionally is made a subg. of *Tipula; Platytipula* Mats., type *P. moiwana* Mats., is referred to *Tipula* s. str.; *Togotipula* Mats., type *T. pulverosa* Mats., provisionally is made a subg. of *Longurio; Odontotipula* Alex., type *O. unifasciata* LW., is a synonym of the subg. *Trichotipula* of *Tipula; Nesotipula* Alex., type *N. pribilovia* Alex., is a subg. of *Tipula; Acutipula* Alex., type *A. gaboonensis* Alex., is a subg. of *Tipula; Vestiplex* Bezzi, type *V. cisalpina* Riedel, is recognized as a subg. of *Tipula*, and is redefined to include the *arctica*-group; SCHUMMELIA (p. 80), n. subg. of *Tipula*, type *T. variicornis*, to include the *variicornis*-group and *continuata;* INDOTIPULA (p. 81), n. subg. of *Tipula*, type *T. walkeri* Brun. (= *tenuipes* Brun., *fulvipennis* Walk.); LUNATIPULA (p. 81), n. subg. of *Tipula*, type *T. lunata* L. (= *ochracea* Mg.); BELLARDINA (p. 82), n. subg. of *Tipula*, type *T. cravieri* Bell.

17713. **EDWARDS, F. W.** Mosquito notes.—VIII. *Bull. Ent. Res.* [*London*] 20(3): 321-343. 4 fig. 1929.—Various unconnected descriptive notes under 8 headings. I. Some varieties of African and Oriental *Anopheles—A. rufipes* Gough (= *A. watsoni* Edw.); *A. rufipes* v. ingrami (p. 322), Gold Coast, Nigeria; *A. theileri* vars. brohieri, Gold Coast, hancocki, Uganda, Nigeria, and seydeli, Belgian Congo (p. 322); *A. gigas* v. baileyi (p. 323), Tibet, W. China; *A. lindesaii* v. cameronensis (p. 323), Malay Peninsula; *A. hyrcanus* Pall., 5 varieties redefined. II. New and little-known African culicines—*Aëdes* (*Aëdimorphus*) phyllolabis* (p. 324), Belgian Congo; *Aëdomyia furfurea* (End.), distinct from *A. venustipes* Skuse and *A. africana* N-L.; key to spp. of *Aëdomyia; Culex* schwetzi* (p. 327), Belgian Congo; *Culex* philipi* (p. 327), Nigeria. III. Larvae and pupae of *Eretmapodites*. Descriptions of and separate keys for larvae and pupae of 6 or 7 spp.; *E. grahami* Theo. and *E. oidipodeios* Grah., described for first time. IV. Larva and pupa of *Mimomyia plumosa** Theo. Descriptions and figures, V. The larva and pupa of *Culex moucheti** Evans. Descriptions and figures. VI. New species collected by R. W. Paine in Fiji—*Rachionotomyia* rotumana (p. 337); *Culex* albinervis (p. 338). VII. Forms referred to the subg. *Skusea* of *Aëdes*.—Analysis of subgeneric characters and division into 5 subgenera—*Skusea*, with genotype *A. pembaensis* Theo.; DENDROSKUSEA, n. subg. (p. 341), type *A. micropterus* Giles; GEOKUSEA n. subg., type *A. fimbripes* Edw.; CANCRAËDES n.

subg. (p. 342), type *cancricomes* Edw.; **RHINOSKUSEA** n. subg. (p. 342), type *longirostris* Leic. VIII. The value of the squamal fringe as a generic character—with lists of genera possessing or wanting the fringe. Types of all new forms in the British Mus.—*C. J. Wainwright.*

17714. **EDWARDS, F. W.** Bibionidae, Scatopsidae, Cecidomyiidae, Culicidae, Thaumaleidae (Orphnephilidae), Anisopodidae (Rhyphidae). In: Diptera of Patagonia and South Chile based mainly on material in the British Museum (Natural History). Part 2, Fasc. 3. pp. 77-119. 3 pl., 3 fig. Brit. Mus. (Nat. Hist.): London, 1930.—(Bibionidae: Pleciinae.) Keys to genera and spp.; (Bibioninae) key to genera of subfamily; *Dilophus*, key to spp.; *D.* dorsalis (*Acanthocnemis d.* Phil.) (p. 81), redescribed; *D.* castanipes (*Acanthocnemis c.* Bigot) (p. 81), redescribed; *D.* flavihalter (p. 82), Argentina (type) and Chile; *D.* calcaratus (p. 83), Patagonia; *D.* patagonicus (p. 84), Patagonia; *D.* flavifemur ♀ (p. 85), Chile; *D.* gracilipes (p. 85), Patagonia, Tierra del Fuego; *D. antarcticus* (p. 86), redescribed; *D.* interruptus ♂ (p. 86), Mechuque I., Chile; *D.* tetracanthus (p. 87), Patagonia; *D.* luteus (p. 88), Chile. (Scatopsidae) family redefined; **ARAUCOSCELIS** (p. 90), new subg. of *Canthyloscelis*, type *C.* (*A.*) pectinata* (p. 90), Patagonia; *C.* (*A.*) pictipennis ♀ (p. 92); (Scatopsinae) discussion of wing venation; key to genera and spp.; *Scatopse notata* L., occurring in Chile and Tierra del Fuego, has apparently been recorded as *Scatopse carolina* Blanch. and *S. carbonaria* Phil.; *S. fuscipes* Mg., occurring in Chile, has apparently been recorded as *S. parvula* Blanch; *S.* setifera* (p. 95), Patagonia; *S.* tubifera* (p. 95), Chile; *S.* constricta* (p. 96), Chile; *Psectrosciara* fuscinervis ♂* (p. 97), Chile; *Ectaetia* cornuta* (p. 98), Chile. (Cecidomyiidae) 12 spp. listed from Chile. (Culicidae) characters of subfamily Dixinae discussed; 5 subgenera of *Dixa* recognized, of which *Paradixa* and *Dixa* are redefined, and subg. **NOTHODIXA** (p. 101), type *D. campbelli* Alex., is added; *D.* (*N.*) *chilensis* Alex. is also included; *D.* (*N.*) nitida* (p. 102), Patagonia; *D.* (*N.*) ensifera ♂* (p. 103), Chile; *D.* (*N.*) atrovittata* (p. 105), Patagonia and Chile. (Culicinae) only 11 spp. known from this region, of which the following are new geographic records,—*Culex dolosus*, Patagonia; *C. articularis*, Chile, Patagonia; *Aëdes albifasciatus*, Chile, Argentina. (Thaumaleidae, Orphnephilidae): *Austrothaumalea* chilensis* (p. 111), Chile; *A.* apicalis* (p. 113) and *A.* setipennis* (p. 113), Patagonia; *A.* nudipennis* (p. 114), Chile; *A.* halteralis ♂* (p. 114), Chile. (Anisopodidae, Rhyphidae) *Anisopus*, description of ♂ hypopygium (p. 116); *A. fuscipennis**, redescribed (p. 117); *A.* major* (p. 118), Patagonia; *A.* andinus* (p. 118), Chile (type), Patagonia. Types in Brit. Mus.

17715. **FREY, RICHARD.** Philippinische Dipteren. VII. Fam. Platystomidae. *Notulae Ent.* [*Helsingfors*] 10(2): 46-64. 1 pl. 1930.—A list is given of 61 spp., of which 38 were previously known, and 23 are here described, including: **XENASPOIDES** (p. 49), between *Xenaspis* and *Elassogaster*, type *X.* ichneumonea ♂* (p. 50); *X.* cyanea ♀* (p. 50); *Plagiostenopterina* (*Meringomeria*) pallidipes ♂ (p. 51); *Peronotrochus* inermis (p. 52); *Elassogaster* potens ♂ (p. 52), and simplex ♀ (p. 53); **PICROMETOPUS** (p. 53), type *P.* bicolor ♂ (p. 54); *Lamprogaster* amitina (p. 55), and obliqua (p. 56); *Pterogenia*, key to spp.; *P.* hamifera* (p. 58), boettcheri ♀ (p. 58), flavicornis (p. 59), and subcruciata* (p. 60); *Euprosopia* chalybea ♀* (p. 60), and nobilis ♀* (p. 61); *Xiria* clarissa ♀* (p. 62); **RHEGMATOSAGA** (p. 63), near *Rhabdochaeta*, type *R.* insignis ♂* (p. 63), in Imp. Bur. Ent., London.

17716. **GATER, B. A. R.** An improved method of mounting mosquito larvae. *Bull. Ent. Res.* [*London*] 19(4): 367-368. 1929.

17717. **GIBBINS, E. G.** A simple method of making permanent microscope mounts of mosquito larvae. *Bull. Ent. Res.* [*London*] 21(4): 429-430. 1 fig. 1930.

17718. **HERING, MARTIN.** Eine neue gallenerzeugende Agromyzide (Dipt.). *Zeitschr. Wissenschaftl. Insektenbiol.* 22(10): 319-326. 8 fig. 1927.—*Melanagromyza* cecidogena* (p. 325), Berlin-Frohnau, was reared from galls of *Salix aurita* L.

17719. **HOPKINS, G. H. E.** Larvae of Ethiopian mosquitoes. *Bull. Ent. Res.* [*London*] 22(1): 89-104. 15 fig. 1931.—Descriptions of the larvae of *Muscidus africanus**, *Aëdeomyia furfurea**, *Mimomyia mimomyiaformis**, *Culex hancocki**, *C. andersoni**, *C. ingrami* Edw. var.* *C. nebulosus**, and *C. cinereus**. Key to genera of Ethiopian mosquito larvae.

17720. **HULL, F. M.** Some new species of Syrphidae (Diptera) from North and South America. *Trans. Amer. Ent. Soc.* 56(2): 139-148. 1 pl. 1930.—*Syrphus* (*Epistrophe*) flavosignatus ♂* (p. 139), Brit. Columbia; *S.* (*E.*) monachus ♀* (p. 140), Greenland; *Baccha* tristis ♂* (p. 140) and *B.* nodosa ♂* (p. 141), Mexico; *Mesogramma* vitrescens ♂ (p. 142), Colombia; *Meromacrus* fucatus ♀ (p. 143), Dutch Guiana; **SENOCERIA** (p. 144), type *S.* spinifemorata ♂* (p. 145), Brazil; **CACOMYIA** (p. 146), type *C.* cressoni ♂* (p. 147), Mexico; *Volucella* chlorosa ♂ (p. 148), Mexico. Types in Acad. Nat. Sci., Philadelphia.

17721. **JOHNSON, CHARLES W.** Two new species of fungus gnats of the genus Apemon. *Psyche* 38(1): 22-24. 2 fig. 1931.—*Apemon* similis* (p. 22), New Hampshire, and *A.* manteri ♂* (p. 23), Connecticut, types in Boston Soc. Nat. Hist.

17722. **KRÖBER, O.** Die südamerikanischen Arten der Gattung Scione Wlk. (=Rhinotriclista End.) (Dipt.). *Stettiner Ent. Zeitung* 91(2): 141-174. 12 fig. 1930.—Though the author states that he unites *Scione* Wlk. and *Rhinotriclista* End. under the former name, he lists 16 spp. under *Scione* and 14 under *Rhinotriclista*, without preserving any definite sequence in the use of the names, *Scione* is used in the titles of all figures. A key to the ♀♀ is given. The systematic account of spp. includes synonymies, descriptions, and distributional records. *Rhinotriclista* rufipes ♀ (p. 147), Venezuela, type in author's coll.; *R.* immaculata ♀* (p. 149), Venezuela, type in London; *R.* nigripes ♀* (p. 152), Colombia, type in Halle; *Scione* fumipennis ♀* (p. 156), Bolivia (type, in Halle) and Peru; *S.* albohirta ♀ (p. 159), Peru, type in author's coll.; *S.* huancabambae ♀ (p. 160), Peru, type in author's coll.; *S.* obscurefemorata (p. 172), Colombia (type, in Berlin) and Peru.

17723. **KRÖBER, O.** Die Tribus Pangoniini der neotropischen Region. *Zool. Anz.* 89(7/10): 211-228. 10 fig. 1930.—Keys to 8 genera and numerous spp. are provided. The systematic list of spp. includes descriptions, taxonomic remarks, statements of distribution, citations of types, and figures. *Mycteromyia* robusta* (p. 219), locality unknown, type in Wien; **CAENOPANGONIA** (p. 221), erected for *C.* hirtipalpis* (Big.), n. comb. (p. 221); **LEPTOFIDENA** (p. 222), erected for *L.* beelzebul ♀* (p. 223), Argentina, type in Halle; *Lilaea* albifrons (Macq.), n. comb. (p. 224); *Laphriomyia* palliditarsis ♀* (p. 226) and *L. miniatistola* v. flavithorax ♀* (p. 228), Bolivia, types in Halle.

(p. 144); *A.* rotundicornis ♂ (p. 145); *A.* latipalpis ♀ (p. 145); *A.* dubia ♀ (p. 146); *A.* (*Pseudactia*) hirticeps ♂* (p. 146); **NEOPLECTOPS** (p. 147), resembling *Actia* and *Plectops*, type *N.* nudibasis ♂* (p. 147); *Hypochaetopsis* cinereofrons ♂* (p. 149). A few previously described spp. are also discussed.

17725. **MALLOCH, J. R.** Notes on Australian Diptera. XXIV. *Proc. Linn. Soc. N. S. Wales* 55(3): 303-353. 44 fig. 1930.—This paper completes the notes on Tachinidae, and includes keys to genera and spp. There are taxonomic remarks and locality and date records for previously known forms. New forms are from New South Wales unless otherwise stated. *Actia* (*Schizoceromyia*) invalida* (p. 305); **TARARACTIA** (p. 305), n. subg. of *Actia*, type *Actia* baldwini ♂* (p. 306), Queensland; *A.* (*A.*) *norma* Malloch, emended description; *A.* (*A.*) lata ♂ (p. 307); *A.* (*A.*) parviseta ♂ (p. 308); *A.* (*A.*) *darwini* Malloch, first description of ♀; *A.* (*A.*) brevis ♂ (p. 309); *A.* (*A.*) nigritula ♀ (p. 309), Queensland (type) and New South Wales; *A.* (*A.*) argentifrons ♂ (p. 309); *A.* (*A.*) plebeia* (p. 310); *Chaetophthalmus* Brauer & Berg. (=*Amphibolosia* Surcouf); *C.* biseriatus ♂ (p. 311); *Cylindromyia* nigricosta ♂* (p. 312); *C.* atratula* (p. 314); *C.* sydneyensis ♀* (p. 314); *C.* brunnea ♂* (p. 315), W. Australia; *C.* tricolor ♀ (p. 315); *Cuphocera* pilosa* (p. 316); *C.* setigera ♂* (p. 318); *C.* emmesia ♂* (p. 318), W. Australia; *Voria ruralis** Meigen, genus and sp. new to Australia (New South Wales); *Stomatomyia* micropalpis ♂* (p. 321); **VORINA** (p. 321), near *Hyleorus*, type *V.* setibasis* (p. 321); **MACROPIA** (p. 322), type *M.* rufiventris* (p. 322); *Hyalomyodes* australasiae ♂* (p. 325); **PHOROCEROSTOMA** (*Phorocerosoma* Malloch, not Towns.) (p. 326); *Euphasia picta** (Brauer & Berg.), emended description; **GERALDIA** (p. 327), type *G.* hirticeps (p. 328), W. Australia; **ACUCERA** (p. 328), resembling *Froggattimyia*, type *A.* montana (p. 328) [figured as *A. monticola*, p. 327]; **PILIMYIA** (p. 329), similar to *Zita*, type *P.* lasiophthalma ♂* (p. 329); **PYGIDIA** (p. 330), similar to *Zita*, type *P.* rufolateralis ♂* (p. 331); **DELTA** (p. 332), type *D.* australiensis* (p. 332), W. Australia; *D.* grisea (p. 333), W. Australia; *D.* opaca ♀ (p. 334); *D.* scutellata (p. 334), W. Australia; *D.* major (p. 334), New South Wales (type) and Queensland; **VORIELLA** (p. 335), near *Delta*, type *V. recedens* "n. sp." [nomen nudum]; *V.* uniseta* (p. 335); *V.* armiceps ♀* (p. 336), W. Australia; *V.* inconspicua ♀ (p. 336); *Myothyria* fergusoni* (p. 339), W. Australia; *M.* armata ♀ (p. 340); *Semisuturia* Malloch, reduced from generic to subgeneric rank, under *Doddiana* Curran; *D.* parviseta ♀ (p. 341); *D. pallens* Curran, emended description; *D.* flavifrons ♀ (p. 342), Queensland; *Quadra* dissimilis ♂ (p. 343); *Austrophorocera* Townsend, emended diagnosis; **APILIA** (p. 345), resembling *Phorocera*, type *A.* cilifera ♂ (p. 345) [figured as *A. setifera*, p. 346], Queensland; **VESPIVORA** (p. 347), related to *Frontina*, type *V.* nigriventris (p. 347), Queensland, parasitic on wasps; *Winthemia* diversa ♂ (p. 348); *W.* albicens ♂ (p. 349); **CALOPYGIDIA** (p. 349), similar to *Quadra*, type *C.* analis* (p. 350); *Sturmia* semirufa ♂ (p. 351), Queensland. One new sp. from New Zealand is described; *Protohystricia* huttoni ♂ (p. 352).

17726. **MELIS, ANTONIO.** Osservazioni anatomomorfologiche sulle larve del Dacus oleae Rossi e del Bibio hortulanus L. [Anatomical studies on fly larvae.] *Rivista Biol.* 10(3/4): 3-43. 8 fig. 1928.—Detailed external anatomy of larvae of *Dacus* and *Bibio*. Histology of external parts of respiratory system, with especial attention to structure and mechanism of the stigmata. —*R. A. Muttkowski.*

17727. **MUNRO, H. K.** New Trypetidae from South Africa (Dipt.). *Bull. Ent. Res.* [*London*] 20(4): 391-401. 1 pl. 1929.—*Dacus* (*Dacus*) stentor ♂* (p. 391), Transvaal; *D. brevistriga* Walk. (=*D. asclepiadens* Bez.); **NIPPIA** (p. 392), type *N.* alboscutellata ♀* (p. 393), Transvaal; *Perilampsis* amazuluana ♂* (p. 394), Zululand; *Pardalaspis* scaevolae* (p. 394), Durban, larvae infesting fruits of *Scaevola lobelia*; notes are given on the genus *Afreutreta* Bez.; **PARAFREUTRETA** (p. 396), related to *Afreutreta*, type *P.* conferta (*Camaromyia c.* Bez.) (p. 397); *P.* pretoriae ♂* (p. 397), Pretoria; *P.* bryanti ♀* (p. 398), Cape Province, reared from puparia in stem-galls on *Senecio longiflora*; *Trypanea* lignoptera* (p. 399); **INSIZWA** (p. 400), allied to *Euaresta* and *Euarestella*, type *I.* striatifrons* (p. 400), Natal, reared from puparia on flowers of *Gazania uniflora*.

17728. **PARENT, O.** Ergebnisse einer zoologischen Sammelreise nach Brasilien, insbesondere in das Amazonasgebiet, ausgeführt von Dr. H. Zerny. III. Teil. Diptera: Dolichopodidae. *Ann. Naturhist. Mus. Wien* 44: 5-26. 30 fig. 1930.—Descriptions of new spp. as follows: *Condylostylus* pectinator* (p. 6); *C.* ocellatus* (p. 8); *C.* lavatus ♂* (p. 10); *C.* luteicinctus ♀* (p. 11); *C.* bisetosus ♀* (p. 12); **CHEIROCERUS** (p. 13), type *C.* palmaticornis ♂* (p. 13); *Hercostomus* problematicus* (p. 14); *Paraclius*, key to spp.; *P.* excisicornis* (p. 16); *P.* parvulus* (p. 17); *Diaphorus*, key to spp.; *D.* amazonicus ♂* (p. 19); *D.* viduus ♀* (p. 20); *D.* pruinosus ♀* (p. 21); *Micromorphus* plebeius ♀* (p. 21); *Sympycnus*, key to spp.; *S.* albipalpus* (p. 22); *S.* latipes* (p. 23); *Chrysotus* grandicornis (*C. magnicornis* Duzee) (p. 26).

17729. **PATANÉ, CARLO.** Sulla distribuzione di "Stegomyia fasciata" in Cirenaica. Sua frequenza ed abitudini biologiche in Bengasi, nelle diverse stagioni. [Distribution of S. fasciata in Cyrenaica. Its prevalence and biological habits in Bengasi, during various seasons.] *Arch. Ital. Sci. Med. Coloniale* 8(5): 262-270. 1927.

17730 **PHILIP, CORNELIUS B.** Two new species of Uranotaenia (Culicidae) from Nigeria, with notes on the genus in the Ethiopian region. *Bull. Ent. Res.* [*London*] 22(2): 183-193. 2 fig. 1931.—*Uranotaenia*, keys to adults, larvae, and pupae of spp.; *U.* philonuxia* (p. 188); *U.* caliginosa (p. 190).

17731. **REICHENSPERGER, A.** Beitrag zur Kenntnis der Termitoxeniidae (Dipt.). *Zool. Anz.* 93(11/12): 289-306. 10 fig. 1931.—The author agrees with Schmitz in considering this family distinct from the *Phoridae*. He gives an emended diagnosis of the family. *Termitomyia* gracilis* (p. 294); **TERMITOSTROMA** (p. 297), resembling *Ptochomyia*, type *T.* schmitzi* (p. 299); **TERMITOSAGMA** (p. 302), resembling *Termitosphaera*, type *T.* henningsi* (p. 303). The new spp. are from Tanganyika, and occur as brood parasites in the nests of the termite *Amplitermes natalensis*.

17732. **REINHARD, H. J.** A synopsis of the genus Macromeigenia including the description of one new species. (Diptera: Tachinidae.) *Ent. News* 41(8): 261-264. 1930.—Key is given to the spp., including *M.* owenii ♂ (p. 263), Texas, type in U. S. Nation. Mus.

17733. **RICHARDS, O. W.** Systematic notes on the Borboridae (Diptera) with descriptions of new species of Leptocera (Limosina). *Ent. Month. Mag.* 65(783): 171-176. 2 figs. 1929.—A new subg., **PHILOCOPRELLA** (p. 172), of *Leptocera* Ol. is proposed, and the following new spp.; *Leptocera* (*Philocoprella*) arvernica ♂* (p. 172) *L.* cambrica (p. 174); *L.* (*Thoracochaeta*) penteseta ♀ (p. 174); *L.* collini (p. 175); and *L.* grenstedi (p. 175) ♀, with var. simplex (p. 175). All types in British Mus.—*H. M. Gilkey.*

17734. **RIEDEL, M. P.** Tachinidae. I. *Ent. Anzeiger* 10(14): 262-266. 1930.—This article begins the series of publications of certain parasites for "Verbandes Deutschsprachlicher Entomologen-Vereine." This society supports a "receiving station" to which breeders can send their material for determination and descriptions by experts. Author lists 10 spp. of Tachinidae, among which *Hadena rurea* is a new host of *Masicera pratensis*.

17735. **RIEDEL, M. P.** Die subalpine Fliegenfauna von Reinerz (Glatzer Gebirge, Schlesien). [The subalpine fly fauna of Reinerz, Glatz Mts., Silesia.] *Zeitschr. Wiss. Insektenbiol.* 25(3/5): 71-81. 1930.—A list of Diptera collected by the author in this region 1927-1929.

17736. **SÉGUY, E. Un nouveau Calliphorine de la Guyane française.** *Ann. Soc. Ent. France* 96(3/4): 262. 1927.—**PSEUDORMIA**, type *P.* **inflata**, in author's coll.

17737. **SÉGUY, E. Un Mydaide nouveau de l'Afrique Orientale Portugaise.** *Ann. Soc. Ent. France* 98(1/2): 110. 1929.—**HELEOMYDAS** (p. 110), type *H.* **lesnei** ♂.

17738. **SHANNON, RAYMOND C. Una nueva especie de Syrphidae: Quichuana rieseli.** *Rev. Soc. Ent. Argentina* 1(3): 5-6. 1927.—*Q.* rieseli ♀ (p. 5), Argentina, type in author's coll.

17739. **SMITH, R. O. A. The breeding of sandflies in nature and in the laboratory.** *Far East. Assoc. Trop. Med. Trans. 7th Congr. Brit. India* 3: 182-185. 1927 [1928].

17740. **[STACKELBERG, A. A.] ШТАКЕЛЬБЕРГ, А. А. К фауне Drosophilidae (Diptera) Ингрии. [Contribution to the Drosophilidae of Ingria, Russia.]** Русское Энтомологическое Обозрение (*Rev. Russe d'Ent.*) 24(1/2): 63-66. 1930.—Detailed locality records, with notes on general distribution, for 27 spp., 17 of which are reported from this region for the first time.

17741. **SZILÁDY, Z. New and Old World horseflies.** *Biologica Hungarica* 1(7): 1-30. 1 pl., 7 fig. 1926.—Oriental Tabanidae are treated on pp. 1-21. The author reviews recent literature and gives a key to the spp. of *Siridorhina*. *S.* **zernyi** ♀ (p. 2), Ceylon; *S.* **körösicsomana** (p. 3), India [type depository not given]; **PSYLOCHRYSOPS** (*Neochrysops* Szil., not Walton) (p. 3); *P.* **unizona** (p. 3), Borneo, type in Budapest Mus.; *Silvius* **piceus** ♀* (p. 4) and *S.* **ceylonicus** ♂ (p. 5), Ceylon; *Chasmiella* **polyzona** ♀* (p. 5), India; *Haematopota* **birói** (p. 5), India, type in Budapest Mus.; *H. b.* var. **montium** (p. 6), India [type dep. not given]; *H. unizonata* v. **matherani** ♀ (p. 6) and *H.* **flavicornis** ♀ (p. 6), India, types in Budapest Mus.; *H.* **atrata** ♀ (p. 7), China; *H.* **tenasserimi** ♀ (p. 7), Burma; *H. t.* var. **tonkiniana** ♀ (p. 8), Tonkin [type dep. not given]; *Lissimas* **moestus** ♂* (p. 8) and *Neobolbodimyia* **argentata** ♀* (p. 8), Celebes; **CALLOTABANUS**, n. subg. (p. 10), erected for "group II of Ricardo including the recently described spp. *Tabanus fulvicinctus* Ric., *T. quinquecinctus* Ric., *T. tonglai* Surc., and *T. insidiator* Aust. as well as group I of Ricardo, with exception of *T. bicallosus* Ric." The following emendations of names introduced by Schurmans are proposed: *Haematopota aequitibia* for *H. equitibia; Tabanus latifascia* for *T. latifascies; T. burmanensis* for *T. burmanense; T. aequecinctus* [sic] for *T. equicinctus; T. flavoscutellatus* for *T. flaviscutellatus; T. sumbavensis* for *T. soembavensis; T. aruensis* for *T. aroeensis, T. madurensis* for *T. madoerensis; T. fuscibarba* for *T. fuscibarbis; T. cylindricallus* for *T. cylindricallosus; T. flavovittatus* for *T. flavivittatus; T. flavopilosus* for *T. flavipilosus*. The following new names are proposed (p. 10) for preoccupied names of Schurmans: *Tabanus* **nigrinus** for *T. nigerrimus; T.* **bipustulatus** for *T. bipunctatus; T.* **fenestralis** for *T. fenestratus; T.* **frondosus** for *T. latifrons; T.* **schurmansi** for *T. ruficornis. Tabanus* **cyclops** ♀* (p. 10), locality unknown, type in Budapest Mus.; *T.* (*Callotabanus*) **sagittipalpis** ♀ (p. 11), East India; *T.* (*C.*) **tenasserimi** ♀* (p. 11), Burma; *T.* **széchenyianus** ♂ (p. 12), Tonkin, type in Budapest Mus.; *T.* **lóczyi** ♀* (p. 12), Java; *T.* **indifferens** ♀* (p. 12), India; *T. furunculigenus** Dol. and *T. cinnamoneus** Dol., emended descriptions; *T.* **acallus** ♀ (p. 14), India; *T.* **semirufus** ♂* (p. 14), Tonkin; *T. elongatus** Wied., emended descr.; *T.* **rubidoides** ♀ (p. 15), India, type in Budapest Mus.; *T.* **wallacei** ♀ (p. 15) and *T.* **decoratus** ♀ (p. 16), India; *T.* **invalidus** ♀* (p. 16), Singapore; *T. signifer* Walk., first description of ♀; *T. fuscomaculatus* v. **unisignatus** (p. 17), Celebes; *T. peculiaris* v. **kashmirianus** ♀ (p. 17), locality not given; *T.* **destructus** ♀ (p. 17), S. Asia; *T.* **pictiventris** ♀* (p. 17), Borneo; *T.* **rufimedius** ♀* (p. 18), Tonkin; *T. exoticus* v. **fulvipes** (p. 18), Shantung, type in Dahlem Mus.; *T.* **limbatus** ♀* (p. 18), locality unknown, type in Budapest Mus.; *T.* **infamis** (p. 19), Borneo; *T.* **lucifer** (p. 19), China, type in Budapest Mus.; *T. palpalis* v. **incertus** (p. 19), East India; *T.* **xanti*** ♀ (p. 19), Celebes; *T. angustilimbatus* v. **particolor** ♀ (p. 20), Ceylon; *T.* (*Therioplectes*) **latus** ♀ (p. 20), Burma; *T.* (*Therioplectes*) **altaianus** ♀ (p. 20), Siberia. Types of new spp. are, unless otherwise stated, in Vienna Mus. There are taxonomic remarks on several previously known spp., and new locality records for 13 additional spp. Central American Tabanidae are treated on pp. 21-27, all but one of the types being in the Dahlem Mus. *Lepidoselaga* **major** (p. 21), Cuba; *Styposelaga* **punctipennis** (*Silvius p.* Brun.) (p. 21); *Tabanus* **flavifrons*** (p. 22), Cuba; *T. townsendi** Johns., emended description; *T. yucatanus** Towns., emended descr.; *T.* **bellardii** ♀* (p. 23), Cuba; *T.* **floridanus** ♀* (p. 24), Florida; *T.* **cubanus** ♀ (p. 24) and *T.* **laevicallus** ♀* (p. 25), Cuba; **LOPHOTABANUS**, n. subg. (p. 25), provisionally proposed to include *Tabanus deflippii, T. albonotatus*, and the following 3 spp.: *T.* (*Lophotabanus*) **bifloccus** ♂* (p. 25) and *T.* (*L.*) **dorsifloccus** ♀* (p. 26), Cuba; *T.* (*L.*) **druyvesteijni*** (p. 26), Trinidad, Panama, and Dutch Guiana, type in Budapest Mus. A revision of the genus *Scione* Walk. (*Diclisa* Schin.) is given on pp. 27-30. An emended diagnosis of the genus is given, and there is a key to the spp. The types of the following are in the Budapest Mus.; *Scione* **minuta** (p. 28), Colombia; *S.* **picta** ♀ (p. 29), Bolivia; *S.* **crassa** ♀ (p. 29), Peru; *S.* **costaricana** ♀ (p. 29), Costa Rica; *S.* **punctata** ♀ (p. 29), Colombia; *S.* **aurea** ♀ (p. 30), Costa Rica. A little-known North American *Tabanus* is treated on p. 30. Although the habitat of *T. difficilis** Wied. has been recorded as unknown, the type, in the Vienna Mus., is from North America. An emended description is given.

17742. **VAN DUZEE, M. C. New species of Dolichopodidae from North America and the West Indies.** *Canadian Ent.* 62(4): 84-87. 1930.—*Thinophilus* **pruinosus** (p. 84), Colorado, type in author's coll.; *Chrusotus* **arkansensis** ♂ (p. 84), Arkansas, *Hercostomus* (*Gymnopternus*) **pallidiciliatus** (p. 85), Massachusetts, *Pelastoneurus* **seticauda** ♂ (p. 85), Missouri, and *Diaphorus* **parvulus** (p. 86), St. Vincent Is. (West Indies), types in Univ. Arkansas.

HEMIPTERA AND HOMOPTERA

H. H. KNIGHT, *Editor*, Hemiptera

Z. P. METCALF, *Editor*, Homoptera

(See also in this issue Entries 16790, 16791, 16793, 16831, 16838, 17063)

(6 spp.), and Aradoideae (1 sp.). Part III treats the Reduvioideae (6 spp.), Cimicoideae (13 spp.), Gerroideae (4 spp.), Notonectoideae (4 spp.), Corixoideae (1 sp.), Homoptera, Cicadoideae (30 spp.), and Fulgoroideae (13 spp.). Brief descriptions are given for all spp. considered, and mention is made of food plants.

17745. **VREURICK, G. Liste d'Hémiptères intéressants.** *Bull. et Ann. Soc. Ent. Belgique* 71(5): 99-100. 1931.—A list with collecting records of 31 spp. of Heteroptera and Homoptera from Belgium.

17746. **WNUKOWSKY, W. Beiträge zur Kenntnis der Rhynchoten-Fauna des Bezirks Omsk.** *Mitteil. Deutschen Ent. Ges.* 2(1): 9-16. 1931.—A record of 23 spp. of Homoptera and 50 spp. of Heteroptera.

HEMIPTERA

17747. **BERGEVIN, ERNEST de. Description d'une nouvelle espèce d'Alphocoris (Hémiptère Scutellerinae) provenant des chasses de M. de Peyerimhoff au Hoggar.** *Bull. Soc. Hist. Nat. Afrique du Nord* 22(5): 152-154. 1 fig. 1931.—*Alphocoris* **pachycephalus*** ♀ (p. 152), Algeria.

17748. **BLÖTE, H. C. Nederlandsche Hemiptera in 's Rijks Museum van Natuurlijke Historie. I. Mesoveliidae, Hebridae, Veliidae, Gerridae, Hydrometridae, Aradidae, Lygaeidae en Pyrrhocoridae.** *Zool. Mededeel.* [*Leiden*] 13(3/4): 241-258. 1930.—Collecting records of 1 Mesoveliidae, 2 Hebridae, 2 Veliidae, 8 Gerridae, 1 Hydrometridae, 4 Aradidae, 53 Lygaeidae, and 1 Pyrrhocoridae.

17749. **BLÖTE, H. C. Catalogue of the Pyrrhocoridae in 's Rijks Museum van Natuurlijke Historie.** *Zool Mededeel.* [*Leiden*] 14(1/2): 97-136. 6 fig. 1931.—A critical study of the material in the Leiden Mus. with all records, and with notes on Walker, Distant, and Fabricius types in the British Mus. The following new data are presented: *Acinocoris lunaris* Gmel. (=*A. includens* Walker); *Euryophthalmus* **fulvipes** (p. 98), Curaçao; *Physopelta* **parviceps*** (p. 100), Japan; *Dindymellus coimbatoriensis*, referred to *Iphita; Physopelta seria* Breddin, and perhaps *P. pilosa* Stål and *P. flavipes* Taeuber, referred to *Delecampius; D. typicus* Distant (=*Physopelta villosa* Bredd.); *Antilochus* **coloratus** (*Dysdercus c.* Walker) (p. 102); *A. c.* var. **scutifer** (*Antilochus s.* Walker) is not a synonym of *A. discifer* Stål; *A. d.* var. **rufifemoratus** (p. 103), Saleyer Is.; *Antilochus histrionicus* Stål is restricted to his var. *a; A.* **latiusculus** (p. 103), Timor, Wetter Is., Tenimber; *Ectatops ophthalmicus* v. **nigriventris** (p. 106), Timor; *E.* **simalurensis*** (p. 106), Simalur; **PSEUDINDRA** (p. 107), near *Aeschines*, erected for *Indra glebula* Bredd., *I. timarchula* Bredd., and *P.* **orthocephaloides** (*Indra o.* Bredd.); *Dindymus albicornis* v. **pulcher** (*D. p.* Stål) (p. 109); *D.* **atritarsis** (p. 109), Morotai; *D.* **brevis** (p. 109), Formosa; *D.* **costalis** (*Melamphaus c.* Walker) (p. 110); *D.* **flavipennis** (p. 110), New Guinea; *D.* **longicollis*** (p. 111), Nias; *D.* **obscurus** (p. 111), Java; *D. pyrochrous* v. **rufibasis** ♀ (p. 112), Gebeh; *D. rubiginosus* v. **subsanguineus** ♀ (p. 113), Nias; *D.* **seminiger** (p. 113), Sumatra, Tapanoeli; *D. s.* var. **univittatus** (p. 114), Sumatra; *D.* **triangulifer** (p. 114), Timor; *Scantius* **aethiopicus** (*Delecampium a.* Distant) (p. 116); *S.* **rhodesianus** (*D. r.* Dist.) (p. 117); *Dysdercus antennatus* Dist., referred to *Dindymus; Dysdercus* **brevis** (p. 117), São Paulo (Brazil) (type) and Peru; *Dysdercus cingulatus* F. (=*D. megalopygus* Bredd.); *D.* **collaris** (p. 119), Colombia; *D.* **columbicus** (p. 120), Colombia; *D. mundus* Walk. and *D. splendidus* Dist., referred as varieties of *D. concinnus* Stål; *D. crucifer* Stål (=*Dindymus simplex* Walker); *Dysdercus fulvoniger* de Geer (=*D. howardi* Ballou); *D.* **fuscofasciatus** (p. 121), Dutch Guiana; *D.* **honestus** (p. 122), Chapada (Brazil) (type, in Brit. Mus.) and Espirito Santo (Brazil); *D.* **imitator** (p. 123), Peru (type) and Bolivia; *D. i.* var. **pseudo-annulus** (p. 123), Bolivia (type) and Peru; *D. i.* var. **pseudoruficollis** (p. 124), Peru; *D.* **immarginatus** (p. 124), São Paulo (Brazil); *D.* **incarnatus*** (p. 124), Celebes; *D. incertus* v. **flavipenuis** [sic] (p. 126), Panama; *D.* **infuscatus** (p. 126), Dutch Guiana; *D.* **jacobsoni** ♂* (p. 127), Simaloer Is.; *D. mimus* v. **distanti** (p 128), Trinidad (type), Panama, and Bolivia; *D.* **pallidus** (p. 129), Venezuela; *D. poecilus* v. **parvisignatus** (p. 130), Sumatra, E. Indian Is., and Philippines; *D. ruficollis* v. **albomembranaceus** (p. 132), São Paulo (type), Para, Rio de Janeiro, and Espirito Santo; *D.* **transversalis** (p. 132), Wetter (type), Java, Bali, Timor and Key Isls. The article closes with a key to 19 spp. of *Dysdercus* allied to *D. ruficollis*. Except as indicated, types are in Leiden Mus.

17750. **CHINA, W. E. A new South African species of Rhagadotarsus, Bredd., representing a new subgenus (Hemiptera-Heteroptera, Gerridae).** *Ann. and Mag. Nat. Hist.* 8(46): 407-410. 1 fig. 1931.—**CAPRIVIA** (p. 408), n. subg. in *Rhagadotarsus*, type *R.* (*C.*) **hutchinsoni** ♂* (p. 408), South Africa.

17751. **GOURSAT, H. Description d'un Odontopus nouveau (Hem. Pyrrhocoridae) des collections du British Museum.** *Bull. Soc. Ent. France* 1931(10): 167-168. 1931. —*O.* somaliensis, British Somaliland.—*S. B. Fracker.*

17752. **PACK, H. J., and G. F. KNOWLTON. Notes on Utah Hemiptera.** *Canadian Ent.* 62(11): 248-250. 1930.—Collecting records of 5 Scutelleridae, 6 Cydnidae, and 25 Pentatomidae.

17753. **TORRE-BUENO, J. R. de la. On some New England Heteroptera.** *Bull. Brooklyn Ent. Soc.* 24(5): 310-313. 1929.—Collecting records of 36 spp. from Massachusetts and 9 spp. from Maine.

17754. **TORRE-BUENO, J. R. de la. On the Heteroptera collected by George P. Engelhardt in the south and west.** *Bull. Brooklyn Ent. Soc.* 25(2): 107-108. 1930.—Records of collections in Texas and Florida.

17755. **WALLEY, G. STUART. Notes and descriptions of species of Arctocorixa from Ontario and Quebec (Hemip., Corixidae).** *Canadian Ent.* 62(12): 280-286. 1 pl. 1930.—Collection records on 19 described spp. (with key) and the following: *Arctocorixa* **quebecensis*** (p. 281) and *A.* **transfigurata*** (p. 282), Quebec; *A.* **semilucida*** (p. 284), Ontario. Types in Canadian Natl. Coll.

HOMOPTERA

17756. **BEAMER, L. D., and R. H. BEAMER. Biological notes on some western cicadas.** *Jour. New York Ent. Soc.* 38(3): 291-305. 1930.—Notes on the songs, nesting habits, and general habitat of 31 spp. and varieties of Cicadidae in Kansas, New Mexico, Arizona, California, and Utah.

17757. **BUYS, JOHN L. Leafhoppers of Mt. Marcy and Mt. Macintyre, Essex Co., New York (Homoptera, Cicadellidae).** *Jour. New York Ent. Soc.* 39(2): 139-143. 1931.—Records of 19 leafhoppers from Mt. Marcy, and 13 spp. from Mt. Macintyre.

17758. **CHU, H. J. Notes on the life-history of Lycorma delicatula White in Nanking.** *Peking Soc. Nat. Hist. Bull.* 5(3): 33-35. 1931.—This lantern-fly occurs on *Ailanthus altissima* and *Melia azederach*. Brief notes are presented on the egg stage, nymphal habits, habitat, mating, and oviposition.

17759. **FRANSSEN, C. J. H. De Biologie en systematiek der Nederlandsche "zwarte bladluizen." [Biology and classification of the Dutch "black aphids."]** *Natuurhist. Maandblad* [*Limburg*] 17(4): 58-60; (5): 70-76; (6): 80-87. 5 fig. 1928.—The black aphids (*Aphis* spp.) in Holland are here divided into 5 groups, namely *fabae, acetosae, genistae, viciae,* and *laburni*. A key is given to these groups with notes on their biology, and the characters common to the spp. in each are enumerated. Two new spp. are described: *A.* **iridis*** (p. 76), Netherlands, on *Iris;* and *A.* **sarothamni*** (p. 86), Netherlands and England, on *Sarothamnus vulgaris.*—*C. J. H. Franssen.*

17760. **HOTTES, F. C. The name Cinara versus the name Lachnus.** *Proc. Biol. Soc. Washington* 43: 185-188. 1930.—*Cinara* Curtis has as its type *Aphis pini* L., whereas the type of *Lachnus* is *Aphis roboris* L. (=*L. fasciatus* Burm.); *Cinara* **fornacula** (p. 186), apterous viviparous ♀, Minnesota, on blue spruce (type), and Colo-

rado, type in coll. O. W. Oestlund; *Cinara nudus* Mordw. is not a synonym of *C. pini* L.; *Schizolachnus pineti* (Fabr.) (=*S. tomentosa* DeGeer).

17761. **KLYVER, F. D. Euphyllura arctostaphyli** Schwarz and Euphyllura neveipennis (Schwarz) (Homoptera: Chermidae). A difference in interpretation. *Proc. Ent. Soc. Washington* 32(9): 153-160. 1 pl. 1930.—*E. arctostaphyli** and *E. neveipennis** are distinct spp.

17762. **KUSNEZOV, VICTOR. Uebersicht der Gattungen des Tribus Orgeriaria (Homoptera-Cixiidae).** *Ent. Zeitschr., Frankfurt a/M* 44(4): 58-60. 1930.—A key to 13 genera of which **OTORGERIUS** (p. 59), **SPHENOCRATOIDES** (p. 59), **ANORGERIOPUS** (p. 59), and **SCHIZORGERIUS** (p. 60) are described as new. [No species names are given in the article as types for the new genera.]

17763. [**KUZNETSOV, VIKTOR.**] КУЗНЕЦОВ, ВИКТОР. Новый вид рода Zyginella P. Löw (Homoptera). [A new sp. of Zyginella.] Русское Энтомологическое Обозрение (*Rev. Russe d'Ent.*) 24(3/4): 197-198. 1 fig. 1930.—*Z. quercus* ♂* (p. 197), Crimea, from oak. Key is given to 4 spp. of the genus.

17764. **LAWSON, PAUL B. Genus Dikraneuroidea gen. n.** (Homoptera, Cicadellidae). *Bull. Brooklyn Ent. Soc.* 24(5): 307-309. 1 pl. 1929.—**DIKRANEUROIDEA** (p. 307), near *Dikraneura*, type *D.* beameri* (p. 307), Texas, type in Snow Entomological Coll., Univ. Kansas.

17765. **LAWSON, PAUL B. Concerning Scolops cockerelli,** (Homoptera, Fulgoridae). *Canadian Ent.* 62(6): 120-122. 1930.—*S. cockerelli* Fowler is distinct from *S. robustus* Ball. Description of ♀ *S. cockerelli* allotype, and a holomorphotype from Texas.

17766. **MAHDIHASSAN, S. The males of lac and pseudo-lac insects.** *Zeitschr. Wiss. Zool.* 138(3): 371-385. 18 fig. 1931.—*Tachardina lobata** and *T. silvestrii** are contrasted with *Lakshadia communis**.

17767. **MAHDIHASSAN, S. Das zweite Larvenstadium der weiblichen Lackschildlaus.** *Zool. Anz.* 94(11/12): 289-304. 16 fig. 1931.—The shellac industry of India amounts to 20 million dollars per annum. The 2nd larval stage of *Lackshadia communis* is described and figured, and illustrations are also given of the same stage of *L. nagoliensis* and *L. mysorensis*.

17768. **MARRINER, T. F. The Cumberland Aleurodes.** *Ent. Rec. & Jour. of Variation* 43(2): 21-23. 1931.—A list of 16 spp., with locality notes, distribution, and abundance.

17769. **MORDVILKO, A. Aphids of the subtribe Hormaphidina.** Доклады Академии Наук СССР., Сер. А. (*Compt. Rend. Acad. Sci. URSS., Sér. A.*) 1930(7): 168-172. 1930.—The subtribe Hormaphidina in tribe Vacunea, subfamily Callipterinae, apparently originated in far eastern Asia. These forms, when hibernating upon secondary hosts, usually assume a peculiar Aleyrodes-like form. The life cycle of several spp. is reviewed.

17770. **MORDVILKO, A. About the origin of heteroecy in plant lice.** Доклады Академии Наук СССР., Сер. А. (*Compt. Rend. Acad. Sci. URSS., Sér. A.*) 1930 (10): 256-260. 1930.—The writer discusses the generational cycles of many genera of Aphidae. Heteroecy cannot take place in the tropics, if even the secondary hosts of the aphids, as well as the primary hosts, survived there, because in that zone the sexual generation disappears; consequently the fundatrices vanish also.

17771. **OSBORN, HERBERT. A new genus and three new species of South American Cicadellidae** (Homoptera). *Ann. Ent. Soc. Amer.* 22(3): 465-467. 1929.—Jassinae: **IDIOTETTIX** (p. 465), type *I. magnificus* (*Thamnotettix m.* Osb.), ♂ described (p. 465); *I.* boliviana (p. 466), Bolivia; *I.* fasciatus (p. 466) and *I.* brunneus (p. 467), Paraguay. Types in author's coll.—*M. W. Boesel.*

17772. **TAKAHASHI, R. Descriptions of some new Formosan Coccidae (Rhynchota).** *Bull. Ent. Res.* [*London*] 22(2): 211-220. 9 fig. 1931.—*Diaspis* gordoniae ♀* (p. 211), on twig of *Gordonia axillaris; Aulacaspis* robusta ♀* (p. 212), on branch of *Bladhia sieboldii; A.* murrayae ♀* (p. 212), on leaf of *Murraya exotica; Pinnaspis* lithocarpi (p. 214) ♀*, larva* on leaf of *Lithocarpus* sp.; *Tsukushiaspis* vermiformis (p. 215), ♀*, larva* on leaf of *Bambusa stenostachya, B.* sp., and *Dendrocalamus latiflorus; T.* phragmitis (p. 216), ♀* larva* on leaf of *Phragmites* sp.; *Parlatoria* machili ♀* (p. 218), on leaf of *Machilus* spp.; *Fiorinia* smilaceti (p. 218), ♀*, larva on leaf of *Smilax* sp.; *Aonidia* (*Greeniella*) lahoarei (p. 219), ♀* larva* on leaf of *Eugenia* sp. Types in Agric. Res. Inst., Formosa.

17773. **TAKAHASHI, R. Coccidae associated with the ant Cremastogaster rogenhoferi Mayr. in Formosa.** *Nat. Hist. Soc. Fukien Christian Univ. Foochow, China* 2: 15-16. 1929.—The coccids living in association with this ant may be arranged in the following categories: (1) true myrmecophiles; these are protected always by this ant and can not live without the association, showing the most advanced stage of trophobiosis; (2) coccids which are almost always protected by this ant, but are sometimes found away from it; (3) coccids which are sometimes found in the tents, being often visited by this ant; (4) coccids which are sometimes visited by the ant, but are not found in the nests or tents; *Pseudococcus citri* Risso, *Ceroplastes rubens* Mask., etc., are illustrations of this type, the most primitive type of the association between the coccids and the ant; (5) coccids which are merely accidental in the nests or tents.

17774. **TAKAHASHI, RYOICHI. A new Mindarus from Japan (Aphididae).** *Trans. Nat. Hist. Soc. Formosa* 21(114): 137-139. 2 fig. 1931.—*M.* japonicus*, alate ♀ (p. 137), on *Abies*, from Okitsu, type in Dept. Agric. Res. Inst., Formosa. The author believes this genus to belong to the Mindarini tribe of the Agrioaphidinae.

HYMENOPTERA

C. F. W. MUESEBECK, *Editor*

(See also in this issue Entries 16779, 16781, 16786, 16790, 16792, 16802, 16837, 16838, 16839, 16842, 16847, 16849, 17467, 17641, 17773, 17860, 18114, 18116)

17775. **ARLE, R. Note sur quelques Béthylides [Hym.] capturés aux environs d'Auxerre (Yonne), avec la description d'une espèce nouvelle du genre Bethylus Latr.** *Bull. Soc. Ent. France* 1929(4): 61-63. 4 fig. 1929.—*B.* berlandi*, type in author's coll., *Epyris niger* Westw., *B. fulvicornis** Curtis and *Pseudisobrachium subcyaneum* Halid., were taken near Auzerre.—*S. B. Fracker.*

17776. **BENOIST, R. Hyménoptères mellifères des environs de Paris.** *Ann. Soc. Ent. France* 95(2/3): 210. 1926.—The author found near Paris: *Bombus cullumanus* ♀, *Andrena julliani, Rophites canus, Osmia tridantata,* and *O. antigae* v. laevior.

17777. **BENOIST, R. Étude sur la faune des Hyménoptères des Alpes Françaises.** *Ann. Soc. Ent. France* 97(3/4): 389-417. 1928.—A list of 348 spp. collected in 1921, 1923, and 1925, with localities.

17778. **BENOIST, R. Les Heriades de la faune Française. (Hym. Apidae).** *Ann. Soc. Ent. France* 98(1/2): 131-141. 1929.—The author points out the difference between the genera *Heriades* and *Osmia* and lists the 16 spp. of the former known to France, with descriptions, synonymy, and key.

17779. **BENOIST, R. Description d'une nouvelle espèce d'Osmie du Japon.** *Ann. Soc. Ent. France* 98(1/2): 142. 1929.—*Osmia* orientalis ♀, type in Paris Mus.

17780. **BENSON, R. B. A preliminary account of the sawflies of Wicken Fen.** *Nat. Hist. Wicken Fen Pt.* 4. 313-323. 1928.—130 spp. of Tenthredinoidea are recorded from Wicken Fen in England, and notes are given

on habits and abundance of many of these. The list is preceded by a discussion of feeding, mating, oviposition, parthenogenetic reproduction, and larval habits and development in Tenthredinoidea.

17781. **BLÜTHGEN, P.** Beiträge zur Synonymie der Bienengattung Halictus Latr. IV. *Deutsch. Ent. 17782. **CLARK, J.** New Formicidae, with notes on some little-known species. *Proc. Roy. Soc. Victoria* 43 (1): 2-25. 1 pl. 1930.—*Eusphinctus* (*Nothosphinctus*) **brunnicornis*** ♀ (p. 2), *Phyracaces* **clarus*** ♀ ♀ ♂ (p. 3), *P.* **flammeus*** ♀ ♀ (p. 4) and *P.* **flavescens*** ♀ ♀ (p. 5), W. Australia; *Acanthoponera* **nigra** ♀ (p. 6) and *Euponera* (*Trachymesopus*) **pachynoda*** ♀ (p. 7), Victoria; **EUBOTHROPONERA** (p. 8), near *Bothroponera*, type *E.* **dentinodis*** ♀ (p. 9), W. Australia; *E.* **micans*** ♀ (p. 10) and *E.* **bicolor*** ♀ (p. 11), W. Australia; *Polyrhachis* (*Chariomyrma*) **opalescens*** ♀ (p. 11), New Hebrides; *P.* (*Hedomyrma*) **kershawi*** ♀ (p. 12) and *P.* (*Myrmhopla*) **glabrinotum*** ♀ (p. 13), Queensland; *P.* (*M.*) *barnardi* Clark, first description of ♀; *P.* (*Campomyrma*) **gravis*** ♀ (p. 15), central Australia; *P.* (*C.*) **flavibasis*** ♀ ♀ (p. 16), N. So. Wales. The author presents the results of a reexamination of the ants of the Horn Expedition, which had been dealt with by W. F. Kirby and by Froggatt in 1896. *Calomyrmex purpureus* v. *cremophilus* Wheeler (listed by Kirby as *Camponotus impavidus* Forel), ♀ and ♂ described; *Camponotus* (*Tanaemyrmex*) **spenceri** (*C. reticulatus* Kirby, not Roger) (p. 18), ♀ redescribed; *C. denticulatus* Kirby, ♀ redescribed; *C. horni* Kirby, ♀ redescribed; *Iridomyrmex* **flavipes** (*Hypoclinea f.* Kirby,=*Iridomyrmex rostrinotus* Forel) (p. 21); *Bothroponera denticulata* Kirby, ♀ redescribed; *Melophorus bagoti* Lubbock (=*Camponotus cowlei* Frogg.); *Camponotus midas* Frogg., ♀ and ♀ redescribed.

17783. **COCKERELL, T. D. A.** Descriptions and records of bees. CXXIV. *Ann. and Mag. Nat. Hist.* 6(31): 48-57. 1930.—*Megachile felderi* Radosz. (=*M. monticola*); *Ctenoplectra* **kelloggi** ♂ (p. 49); *Parevaspis basalis* ssp. **chinensis** (p. 50); *Coelioxys taiwanensis* ssp. **kelloggi** (p. 50); *Habropoda* **percarinata** ♂ (p. 51); *H.* **nubilipennis** ♀ (p. 52); *Anthophora tsushimensis*, new to China; *A.* **mesopyrrha** (p. 53); *Panurginus* **ogloblini** ♀ (p. 54), Argentina; *Halictus albescens* ssp. **convolvuli** (p. 55), Siam. Unless otherwise stated specimens are from Fukien, China.

17784. **COCKERELL, T. D. A.** African bees of the family Megachilidae (Anthidiinae, Serapista and Lithurgus), mainly from Liberia and the Belgian Congo. (Hymenoptera, Apoidea.) *Rev. Zool. et Bot. Africaines* 19(1): 43-55. 1930.—*Anthidium* **michaelis** (p. 47); *Pachyanthidium cordatum* ssp. **katangense** (p. 47); *P.* (**MICRANTHIDIUM** n. subg.) (p. 45), type *P.* (*M.*) *truncatum* (Smith); *P.* (*M.*) **subtruncatum** (p. 49); *P.* (*M.*) **microdontum** (p. 49); *P.* (*M.*) **xanthostomum** (p. 51); *P.* (*M.*) **libericum** (p. 51), Liberia; *P. truncatum* v. **ferricorne** (p. 52); *P.* (*M.*) **cupripes** (p. 52), Liberia; *P.* (**TRICHANTHIDIUM** n. subg.) (p. 52), with *P.* (*T.*) **occipitale** (p. 52); *Serapista* **aethiops** (p. 54), S. Africa, and *S. denticulata* ssp. **pernigra** (p. 54), types of both in author's coll. Keys are given to spp. of *Pachyanthidium* and *Serapista*; types are in Congo Mus. unless otherwise stated.

17785. **DONISTHORPE, H. St. J. K.** British ants: their life history and classification. 2nd. ed. ix+436pp. 18 pl., 93 fig. Geo. Routledge & Sons, Ltd.: London, 1927. Pr. 25s.

17786. **ELLINGER, TAGE, and HANS SACHTLEBEN.** Notes on the central European parasites of Pyrausta nubilalis Hb. *Internat. Corn Borer Invest. Sci. Repts.* 1927-1928. 109-134. 2 pl., 4 fig. International Live Stock Exposition: Chicago, 1928.—The central European valley resembles the Mississippi valley in climate and agriculture, and the same parasites might be expected to occur in both regions. The list of parasites includes: (Hymenoptera) *Limnerium* **alkae*** (p. 113), Hungary, type in Biologische Reichsanst. Forst- und Landw., Berlin-Dahlem; (Ichneumonidae) **INAREOLATA** (*Dioctes* Foerst. not Ménétr.) (p. 116), with *I.* **punctoria*** (*Dioctes p.* (Rom.)) (p. 116); *Microgaster tibialis* Nees; *Microbracon brevicornis** Wesmael (=*M. vernalis* Szé.); *Eulophus viridulus** Thomson, emended description; (Diptera) *Lydella senilis** Meigen. Distributional, systematic and morphological notes are given for each sp. listed.

17787. **FISCHER, CARLOS R.** Notas biologicas sobre o Crabro tabanicida Fischer 1929 e considerações concernentes ás motucas. [C. tabanicida and discussion of tabanids.] *Arch. Inst. Biol.* [*São Paulo*] 2: 141-162. 3 pl. (1 col.) 1929.—Brood cells of *Crabro tabanicida* from insect burrow in a dead branch of *Enterolobium timbouva* contained various spp. of *Acanthocera, Neotabanus, Dichelacera,* and *Poecilosoma.* The individual cells, separated from one another by a wall of frass,

contained each 2-3 flies, with one larva of the wasp. All the flies had been placed with the apex of the wings towards the entrance, showing that they had been pulled into the burrow head first. Paralyzing of the victims is evidently effected by a sting in the 2nd abdominal segment, along the median line on the dorsal side. More than two-thirds of the flies found in the cells were ♂♂. Historic data on the transmission of diseases by tabanids are given. Artificial control of tabanids the author believes to be impracticable; he favors, rather, control by natural enemies, of which he cites a number. —*C. Zeimet.*

17788. **GUIGLIA, D. Una nuova specie africana del genere Scolia.** *Ann. Mus. Civ. Storia Nat. Genova* 52: 314-317. 1925/1928.—*Scolia* (*Discolia*) feae (p. 314), Portuguese Guinea, type in Mus. Civ. Storia Nat. Genova.

17789. HARTTIG, GUSTAV. **Die mir bekannt gewordenen Diphlebusarten. (Hym.)** *Stettiner Ent. Zeitung* 91(2): 227-232. 1930.—New key to the ♀♀ and ♂♂ of 4 spp., with descriptive remarks.—*C. T. Brandhorst.*

17790. **HOFFMEYER, E. B. Aus Samen gezüchtete Callimomidae. (Callimomidenstudien I.)** *Ent. Meddel.* [*Copenhagen*] 16(6): 323-334. 14 fig. 1929.—The present study is based on an article by Herm. Borries, published in "Tidsskrift for Skovvaesen" vol. 7, Ser. B, in 1895, which, on account of being written in Danish, seems to have remained practically unknown. The author reared a number of specimens obtained from seeds, and describes old and new spp. as follows: *Megastigmus aculeatus* v. nigroflavus* (p. 324), Japan, from *Rosa multiflora*; *M.* seitneri ♀* (p. 327), Denmark, from *Larix decidua*; *M. suspectus* Borr. (=*M. piceae* Seitn.); *M.* rafni ♀* (p. 331), central U. S. A., from *Abies concolor*; *Callimome* seminum ♀ (p. 332) and *Monodontomerus* masii ♀* (p. 332), probably from *Acer campestris* of southern Europe; *Callimome* africanum (*Torymus chlorocopes* Masi) (p. 333); *C.* huberi (*C. tarsale* Huber, not *C. tarsalis* Walker) (p. 333); *C.* kiefferi (*Torymus lasiopterae* Kieffer) (p. 334); *C.* littoralis (*Torymus saphirinus* Boheman) (p. 334); *C.* philippii (*Misocampus laetus* Philippi, not Walker) (p. 334); *C.* rosarum (*Torymus druparum* Mayr, not Boh.) (p. 334); *C.* ruschkai (*Torymus tubicola* Ruschka) (p. 334); *Podagrion* quinquis (*P. quinquedentatum* Schrot., not Ashm.) (p. 334); *Blastophaga* queenslandica (*B. insularis* Girault, not Ashm.) (p. 334). Types of new spp. in author's coll.

17791. **LAIDLAW, W. B. R. Description of a new Indian Sphex.** *Ent. Month. Mag.* 65(785): 232-233. 1 pl. 1929.—*S.* namkumiensis ♀* (p. 232), Bengal, type in Royal Scottish Mus.—*H. M. Gilkey.*

17792. **MALAISE, RENÉ. Växtsteklar-Tenthredinidae. 5.** In: **Insektfaunan inom Abisko Nationalpark. II. Studies under the leadership of Yngve Sjöstedt.** *K. Svenska Vetenskapsakad. Skrifter i Naturskyddsärenden* No. 17. pp. 54-68. 1931.—A list of some 130 spp., with distributional notes. *Emphytus calliblepharus* is new to Sweden.

17793. **MANN, W. M. Notes on Cuban ants of the genus Macromischa (Hymenoptera: Formicidae).** *Proc. Ent. Soc. Washington* 31(8): 161-166. 3 fig. 1929.—*Macromischa pastinifera*, redescribed, new to Cuba; *M. porphyritis*, dealated ♀, ♀*, worker*, notes on nests; *M.* (s. str.) creightoni (p. 163) ♀*, dealated ♀; *M. versicolor*, dealated ♀*.

17794. **MASI, L. Res Ligusticae. LIX. Sul genere Simopterus Förster (Hymen. Chalcididae).** *Ann. Mus. Civ. Storia Nat. Genova* 52: 318-323. 1 fig. 1925/1928.—*Simopterus* is recharacterized; *S.* solaris ♀* (p. 320), Italy, type in Mus. Civ. Genova.

17795. **MENOZZI, C. Una nuova specie di formica del genere Aphaenogaster Mayr del Nord America.** *Boll. Lab. Zool. Gen. e Agraria* [*Portici*] 22: 282-284. 1 fig. 1928/1929.—*A.* (*Deromyrma*) silvestrii* (p. 282), Florida.

17796. **MORLEY, CLAUDE. New Oxyura from Britain.** *Entomologist* [*London*] 64(812): 14-16. 1931.—The following names are validated by description or designation, although first used in a catalog of British Proctotrypidae (Trans. Suffolk Naturalists' Soc. vol. 1, 1929.): CARABIPHAGUS (p. 14), type *Proctotrypes laevifrons* Förster; *Paramesius* spinulosus (*P. spinosus* Kieff., not Ashm.); *Labolips* anommati ♀, *Loxotropa* morleii ♀, type in author's coll.; *Dicopus* cervus, all from England.

17797. **MUESEBECK, C. F. W. Descriptions of a new genus and eight new species of ichneumon-flies, with taxonomic notes.** *Proc. U. S. Nation. Mus.* 79(16): 1-16. 1 fig. 1931.—*Microgaster* Latr. (=*Xanthomicrogaster* Cameron); *Microplitis* Foerst. (=*Dapsilotoma* Cameron); *Apanteles* Foerster (=*Xestapanteles* Cam.); *A.* paralechiae (p. 2), Massachusetts, parasite of *Paralechia pinifoliella*; *A.* depressariae (p. 3), Maine (type) and Massachusetts, parasite of *Depressaria heracliana*; *A.* schaffneri ♀ (p. 4), Pennsylvania, parasite of Cochlidiidae; *A.* halisidotae (p. 5), Maine (type), New York, New Hampshire, and Massachusetts, parasite of *Halisidota maculata*; *A.* cingiliae (p. 6), Massachusetts, parasite of *Cingilia catenaria*; PAROLIGONEURUS (p. 7) (Microgasterinae) near *Oligoneurus*, type *P.* johnsoni ♀* (p. 8), Massachusetts; *Snellenius* Westw., transferred to the Microgasterinae; *S.* philippinensis (*Microplitis p.* Ashm.) (p. 10); *Dirrhope*, note; *Neoneurus* Hal. (=*Ecclites* Foerst.); *Rhinoplus*, notes; *Opius* Wesmael (=*Psyttalia* Walker); *O.* fuscipennis (*Rhinoplus f.* Szep.) (p. 11); *O.* fulvus (*R. f.* Brues) (p. 11); *O.* gahani (*O. fuscipennis* Gahan, not Szep.) (p. 11); *O.* walkeri (p. 12) (*Psyttalia testacea* Walker, not *O. t.* Wesm.); *Heratemis* Walk., redescribed; *Xiphozele* Cam. (=*Cerotopia* End.); *Helorimorpha* Schmied. (=*Scipolabia* End.); *H.* enderleini (*Scipolabia reticulata* End., not *H. r.* (Cam.)); *Rogas* Nees (=*Nebartha* Walk.); *Yelicones* Cam. (=*Rhopalotoma* Cam.); *Euscelinus* is referred to the Dorycitinae; *Microbracon* rhyacioniae (p. 15), South Dakota, parasite of *Rhyacionia* on *Pinus ponderosa*; *M.* cryptorhynchi (p. 16), Massachusetts, parasite of *Cryptorhynchus lapathi*. Types in U. S. Nat. Mus.

17798. **NEVINSON, E. B. Hymenoptera Aculeata.** *Nat. Hist. Wicken Fen* Pt. 3. 253-254. 1926.—93 spp., belonging to the Mutilloidea, Sphecoidea, Vespoidea, and Apoidea, are recorded from Wicken and Burrell Fens, England.

17799. **PARKER, H. L., et W. R. THOMPSON. Contribution à la biologie des Chalcidiens entomophages.** *Ann. Soc. Ent. France* 97(3/4): 425-465. 1928.—The biology of 12 spp. of parasitic chalcid-flies is presented, studied in the neighborhood of Hyères, France. Four of these parasites, *Callimome* sp., *Pseudocatolaccus asphondyliae*, *Oxymorpha intermedia*, and *Eurytoma dentata*, live in the galls of *Asphondylia sarothamni* and *A. calycotomae* on broom, *Calycotome spinosa*. *Mormoniella brevicornis* was reared from *Sarcophaga*, *Lucilia*, *Calliphora*, and *Musca*; the ♀♀ greatly outnumber the ♂♂. *Spalangia nigra* was reared from the puparia of *Musca domestica* and was bred in the laboratory also in *Sarcophaga* puparia. *Copidosoma thompsoni* is a polyembryonic parasite in the caterpillars of *Nothrix senticitella* living on juniper (*Juniperus phoenicae*). Occasional asexual larvae, considered to be simply monstrosities, occur in this sp. *Copidosoma boucheanum*, also a polyembryonic sp., was reared from the caterpillars of *Gelechia pinguinella*, living on *Populus nigra*. Four or five asexual larvae are found in each parasitized host. *Microterys ferrugineus* was reared from *Kermococcus roboris*. The mating and feeding habits and the egg of this parasite are described. *Solenotus* sp. is parasitic on the larvae of *Agromyza* mining in the leaves of alfalfa. From 1 to 7 *Solenotus* larvae in all stages of development may be found on one host, but the sp. is not truly gregarious. The larvae are not cannibalistic and 5 or 6 may reach maturity on the same host. *Tetrastichus* sp. was reared from the ootheca of *Loboptera decipiens*. It lives externally on the larva of *Zeuxevania splendidula*, which is a primary parasite in the ootheca. Its mating and egg-laying habits are described. The biology of *Melittobia acasta* is treated

catalaunalis; Microgaster vacillatrix Wilkinson, parasite of *Filodes costiventralis*. Types in Brit. Mus.

17821. **WILKINSON, D. S. Five new species of Spathius (Hym. Bracon.).** *Bull. Ent. Res.* [*London*] 22 (2): 259-265. 5 fig. 1931.—*S.* **cavillator** ♀* (p. 259), *S.* **elaboratus*** (p. 260), *S.* **festinans*** (p. 261), and *S.* **generosus*** (p. 263), India; *S.* **piperis*** (p. 264), Banka, Dutch East Indies, parasite of *Lophobaris piperis*. Types in Brit. Mus.

17822. **WILKINSON, D. S. Four new species of Ichneumonoidea.** *Bull. Ent. Res.* [*London*] 22(3): 393-397. 1 pl. 1931.—*Glypta* **leucotretae** (p. 393), Southern Rhodesia, on *Argyroploce leucotreta; Mesobracon* **psolopterus*** (p. 394), Sierra Leone, on coffee branch borer; *M. nigriceps*, wing*; *Camptothlipsis*, key to 4 spp.; *C.* **furtifica** (p. 395), India, on *Dichomeris evidantis; C.* **antigastrae** (p. 396), Anglo-Egyptian Sudan, on *Antigastra catalaunalis; Apanteles taragamae*, in Ceylon, on *Margaronia indica*. Types in Brit. Mus.

17823. **WOLCOTT, GEORGE N. Informe del jefe de la seccion de entomologia.** [Report of the entomological section.] *Mem. Est. Exp. Agric. Soc. Nacion. Agra.* [*Peru*] 1929 (1a): 31-62. 12 fig. 1929.—The author discusses insect pests of sugar cane, cotton, and citrus. The following are described, in English: *Ipobracon* (*Iphiaulax*) **rimac*** (p. 36), and *I.* **abancay** (p. 38), on young cane.

MACROLEPIDOPTERA

J. McDUNNOUGH, *Editor*

17824. **BALDUF, W. V. The life history of Achatodes zeae Harris (Lepidoptera: Noctuidae).** *Proc. Ent. Soc. Washington* 31(9): 169-177. 1 fig. 1929.—Notes are given on the habits of the larvae, pupation, pupal period, mating and oviposition. The favored food is the elder, *Sambucus*. The larva feeds on the pith of the stem. The pupal period requires 18-35 days. The eggs are laid in masses, and the total fecundity approaches 500.

17825. **BALDUF, W. V. The oviposition habits of Feltia subgothica Haw. (Noctuidae, Lep.)** *Proc. Ent. Soc. Washington* 33(4): 81-88. 1931.—*F. subgothica* Haw. (=*F. ducens* Walk.) oviposits in the flowerets of *Helianthus* spp., usually in the anther tubes. The egg stage lasts for about 10 days in September. The young larvae feed in the floweret for several days. During the first instar they leave the flower and become cutworms.

17826. **BREYER, ALBERTO. Callicore candrena Godt var. nov. maldonadoi.** *Rev. Soc. Ent. Argentina* 1(5): 1-2. 1 pl. 1927.—From Argentina, type in author's coll.

17827. **CALDWELL, JOHN. A list of butterflies occurring in Fukien Province, China.** *Nat. Hist. Soc. Fukien Christian Univ. Foochow, China* 2: 22-24. 1929.—206 spp. are listed.

17828. **CHAPPELL, A. V. Biological notes on New Zealand Lepidoptera.** *Trans. and Proc. New Zealand Inst.* 60(2): 259-264. 1929.—A life history of *Selidosema modica* on *Hebe leiophylla* with descriptions of stages and notes on habits. The extremely limited distribution is connected with the nearly flightless ♀. Briefer life histories, with description of larva and notes on pupa and cocoon of *Scoparia illota* on *Cyclophorus serpens, Hybernia indocilis* on lupine and *Discaria, Leucania purdii* on *Astelia grandis*. In captivity *S. modica* will eat other spp. of *Hebe*, and *L. purdii* will eat *Cordyline*.—*W. T. M. Forbes*.

17829. **CLARK, AUSTIN H. Notes on some local butterflies.** *Proc. Ent. Soc. Washington* 32(5): 80-82. 1930.—Observations on the time of appearance, haunts, and activities of *Brenthis myrina, Poanes massasoit, P. zabulon, P. hobomok, Hesperia leonardus, Cercyonis alope, Satyrodes eurydice, Megisto cymela, Dryas cybele, Euphydryas phaëton, Erynnis juvenalis, E. icelus, Eurymus eurytheme, E. philodice*, and *Atrytonopsis hianna*.

17830. **CLARK, BENJAMIN P. Descriptions of seven new Sphingidae and a note on one other.** *Proc. New England Zool. Club.* 12: 77-83. 1931.—*Sphinx luscitiosa* ssp. **borealis** ♂ (p. 77), Ontario; *Neogene* **pictus** ♀ (p. 78), Paraguay; *Protambulyx strigilis* ssp. **portoricensis** ♀ (p. 79), Porto Rico; *Aleuron neglectum* ssp. **paraguayana** (p. 79), Paraguay; *Panacra* **hollandiae** ♂ (p. 80), Dutch New Guinea; *Xylophanes* **kaempferi** ♀ (p. 81), Paraguay; *X.* **katharinae** ♀ (p. 82), Mexico; *Chlaenogramma undata undata*, recorded from Tucuman, Argentina.

17831. **DJAKONOV, A. M. Eine neue Erannis- (Hibernia) Art aus dem Ussuri-Gebiet (Lepidoptera, Geometridae).** Русское Энтомологическое Обозрение (*Rev. Russe d'Ent.*) 23(1/2): 107-110. 2 fig. 1929.—*E.* **golda*** (p. 107), Maritime Province, Siberia.

17832. **EVANS, W. H. Lepidoptera-Rhopalocera obtained by Mme. J. Visser-Hooft of The Hague (Holland) during an exploration of previously unknown country in the western Karakorum, N. W. India.** *Tijdschr. voor Ent.* 70(2): 158-162. 1927.—The collection consisted of 27 spp. belonging to 6 families, of which an annotated list is here supplied.

17833. **HALL, ARTHUR. A revision of the genus Phyciodes Hubn. (Lepidoptera Nymphalidae).** *Bull. Hill Mus.* [*London*] 2(2, suppl.): 1-20. 3 pl. (2 col.); (3, suppl.): 21-44. 1928; 3(1, suppl.): 45-94; (2, suppl.): 95-146; (3, suppl.): 147-170. 1929; 4(1, suppl.): 171-204. 1930.—A monographic revision of *Phyciodes* which is divided by key into groups, 20 in *Phyciodes* s. str., and 16 in *Eresia*, which is treated as a section. Complete descriptions are given, with distributional data for each sp. *P. erysice* ssp. **etesiae*** (p. 160), French Guiana, type in Brit. Mus. [The following, designated as new on the plates, were described in the Entomologist (61 (1): 11-13. 1928): *P. tissoides* ♂*, *P. ithra* f. *rufocincta* ♀*, *P. etia* f. *selenoides* ♂*, *P. fontus* ♂*, *P. ithomioides* ssp. *cissia* ♂*, *P. mundina* f. *peraea* ♂*, *P. epione* f. *elenae* ♂*, *P. polinella**, *P. sepultus* ♂*.] *P. phaon* ssp. **maya** ♂ (p. 41), Guatemala, type in author's coll.; *P. mylitta* ssp. **mexicana** (p. 44), Mexico, type in Brit. Mus.; *P. vesta* ssp. **vestalis** (p. 52), Guatemala, type in author's coll.; *P. nazaria* ♂*; *P.* **rima** (p. 11, 205) [in error as *"Prima"* (p. 79)], Surinam, type in Tring Mus.; *P. orthia* ♀*; *P. frisia* ssp. **dubia** (p. 85), Venezuela (type in Brit. Mus.), Colombia, Panama (?); *P. ptolyca ptolyca* ♂*; *P. p.* ssp. **amator** (p. 92) and *P. sitalces* ssp. **saltator** ♂ (p. 96), Mexico, types in Brit. Mus.; *P. dracaena dracaena* ♂*, *P. orticas zamora* ♂*, and *P. acesas acesas* ♂*; *P. catula catula* ab. **fulvocincta** ♀ (p. 117), Peru-Bolivian boundary, type in Brit. Mus.; *P. notus notus* ♂*; *P. n.* form **pullopicta** (p. 124), Peru, type in Tring Mus.; *P. sepultus* ♂*, and *P. morena* ♂*; *P. ofella* ssp. **guaya** ♂ (p. 135), Ecuador, type in author's coll.; *P. carme carme* ♂*; *P. clio* ssp. **estebana** (p. 146), Venezuela, type in Brit. Mus.; *P. c.* ssp. **reducta** (p. 146), Ecuador, Colombia, type in Brit. Mus.; *P. nauplia* ssp. **extensa** (p. 148), Matto Grosso, Brazil, type in Brit. Mus.; *P. letitia nigra* f. **leucophaeoides** ♀ (p. 151), Peru, type in author's coll.; *P. pelonia* f. **hewitsonii** ♀ (p. 164), Ecuador, type in Brit. Mus.; *P. casiphia* ♀* and *P. eutropia mimas* ♂*; *P. margaretha* ssp. **manto** ♂ (p. 185), Colombia, type in Brit. Mus.; *P. moesta m.* form *cerquita* ♂*; *P. mundina* f. **callianira** ♂ (p. 200), Peru, Bolivia, type in author's coll.; *P. callianthina* ♀*; *P. eutropia* ssp. **confirmans** ♂ (p. 205), Costa Rica, type in Brit. Mus.; *P. cyneas* G. & S. and *P. cynisca* G. & S., referred to *Melitaea; Gnathotriche exclamationis* f. **elaea** (*Phyciodes e.* Hew.) (p. 204); *G. e.* form **eleates** (*P. eleates* Weym.) (p. 204); *G. e.* form **vanessoides** (*P.*

vanessoides Röb.) (p. 204); *Vila eueidiformis* ♀ (= *P. metharmoides* Fassl). The genital armature of 33 spp. is illustrated.

17834. HALL, ARTHUR. Some new forms of Nymphalinae (Rhopalocera) from tropical America. *Entomologist* 61(776): 11-13. 1928.—*Phyciodes ithra* ssp. **rufocincta** (p. 11), Argentina, type in author's coll.; *P.* **tissoides** (p. 11), Ecuador, type in Brit. Mus.; *P.* **fontus** ♂ (p. 11), Brit. Mus., and *P. epione* ssp. **elenae** ♂ (p. 13), type in author's coll., all Colombia; *P. mundina* f. **peraea** ♂ (p. 13), Ecuador, type in Hill Mus.; *Vila* **semistalachtis** ♂ (p. 13), Colombia, *Didonis biblis* ssp. **pacifica** ♂ (p. 13), Ecuador, and *Eunica sophonisba* ssp. **mossi** (p. 13), Para, Brazil, types in author's coll.

17835. HALL, ARTHUR. New forms of Nymphalidae (Rhopalocera) in the collection of the British Museum. II. *Entomologist* 63(806): 156-160. 1930.—*Dynamine* **gillotti** ♀ (p. 156), Costa Rica; *Euptoieta claudia* ssp. **perdistincta** ♂ (p. 157), Peru; *Limenitis amphyssa* ssp. **chinensis** ♂ (p. 157), Szechwan (type), Korea; *L. homeyeri* ssp. **meridionalis** (p. 157), *L. albomaculata* ssp. **albidior** (p. 157), and *L. sinensium* ssp. **minor** ♂ (p. 158), Yunnan; *Lebadea martha* ssp. **moorei** (p. 158) and *L. m.* ssp. *m.* form **laxata** (p. 158), Sikkim; *Neptis philyra* ssp. **melior** (p. 158), Yunnan; *N. incongrua* ssp. **batesii** (p. 158), Nigeria (5500 ft.); *Euthalia pratti* ssp. **occidentalis** (p. 159), Szechwan; *E. undosa* ssp. **rickettsi** ♂ (p. 159), Fukien; *E. thibetana* ssp. **insulae** (p. 159), Formosa; *E. japis* ssp. **baweana** (p. 159), Bawean Isl., Java; *Dichorragia nesseus* ssp. **rileyi** ♂ (p. 160), Yunnan; *Helcyra hemina* ssp. **borneensis** ♂ (p. 160), Borneo; *H. chionippe* ssp. **austeni** ♀ (p. 160), Batjan Isl., E. Indies.

17836. HARRIS, LUCIEN Jr. A list of the butterflies of Georgia. *Trans. Georgia Nat. Club* 1(1): 1-27. Map, 1 pl. 1931.—The list contains 165 spp. with notes. *Eurema jucunda* ab. **fusca** ♀ (p. 11), Georgia, type presumably in Emory Univ. Mus.

17837. HEYDEMANN, F. Zur Morphologie, Biologie und Zucht von Dystroma (Cidaria) truncata Hfn. und citrata L. *Internat. Ent. Zeitschr.* 23(21): 249-260; (22): 261-266. 3 pl., 1 fig. 1929.—From morphological and biological considerations *truncata* and *citrata* must be regarded as widely separated and distinct spp. Hybrid-eggs are sterile. The different structure of the genitalia of *citrata* ♂♂ makes copulation mechanically impossible with *truncata* ♀♀; the reciprocal is conceivable, but no hybrids were found in over 800 ♂♂ and ♀♀ examined. One ♀ seen had the maculation of the fore-wing as in *citrata*, but genitalic examination proved it to be a *truncata* ♀.—*A. G. Richards, Jr.*

17838. HOLLAND, W. J. Notes on some American butterflies mainly relating to classification and nomenclature. Part 3. (Cont'd from 20 (1): 55.) *Ann. Carnegie Mus.* 20(2): 255-264. 1931.—*Anthanassa* Scudder should have as its type *Eresia frisia* Poey (*A. cincta* "Edw." Scudder). *Argynnis cybele* v. **krautwurmi** ♀ (p. 256), Michigan; *A. irene* Bdv. (=*A. luski* B. & McD.); *Ascia monuste* v. **crameri** (p. 256); **SPALGINAE** (p. 257), new subf. of Lycaenidae, based on *Spalgis* and *Feniseca*. The type of *Hesperia* Fabr. must be *H. malvae* (L.) as designated by Cuvier; that of *Erynnis* Schrank, *E. comma* as fixed by Scudder (1875). *Pamphila* Fabr. (=*Pamphilidia* Lindsey, *Carterocephalus* Lederer) has as type *P. palaemon*. *Megathymus* **leussleri** (p. 262), Nebraska, probable host *Yucca glauca*. Types in Carnegie Mus.

17839. HOLLAND, W. J. The butterfly book. A popular and scientific manual, describing and depicting all the butterflies of the United States and Canada. New & thoroughly revised ed. xii+424p. 77 col. pl., 199 fig. Doubleday, Doran & Company, Inc.: Garden City, York, 1931.

17840. HUGGINS, H. C. Collecting in the Aran Is *Entomologist* 61(777): 43-44. 1928.—On common thorn were found larvae of *Abraxas grossulariata* ing an extraordinary degree of melanism, whic veloped into a distinct race without signs of mel The Aran race of *Lasiocampa quercus* is distinct. showers the rocks were covered with swarms of of *Setina irrorella* and *Lithosia complanula*. No were seen in flight.

Acrolepia assectella f. **obscurella** (p. 98), Italy; observations on *Phytometra zosimi* and *Hypopta caestrum*.

17850. SIBILLE, JULIAN, et al. **Aberrations de Lépidoptères.** (Continuation.) *Lambillionea* 27(9/10): 73-74; (11): 90; (12): 98. 1927. 28(2): 11-12; (6): 57-60; (8/9): 78; (11): 101-103; (12): 117-118. 1928. 29(1): 2; (2): 17; (3): 34; (5): 65-66; (6): 73-74; (8/9): 98; (10): 110-111; (11): 123. 1929. 30(2): 18-19. 1 pl.; (4): 54. 1 pl.; (5): 70. 1 pl.; (7): 102; (8/9): 122; (12): 178-180. 1930.—Under the heading of "Aberrations of Lepidoptera," various authors have described new aberrations. (Vol. 27) SIBILLE, JULIAN: *Erebia medusa* ab. **semigrisea** ♂ (p. 73), France; *Papilio machaon* ab. **circinatus** ♀ (p. 74) (locality not given); *Pieris napi* ab. **grisea** ♀ (p. 74) and *Malacosoma neustria* ab. **bicolor** ♂ (p. 74), Belgium; *Agrotis primulae* ab. **havana** (p. 74) (loc. not given); *Erebia aethiops* ab. **purpurea** ♀ (p. 74) and *Phragmatobia fuliginosa* ab. **clara** (p. 74), Belgium. **CH. CABEAU:** *Vanessa urticae* ab. **pseudoconnexa** (p. 90), Belgium. **MEZGER:** *Papilio machaon* ab. **biadaperta** (p. 98), Holland. (Vol. 28) CH. CABEAU: *Melitaea aurinia* abs. **deficiens** ♂ **and transversa** (p. 11), "Hockai"; *Argynnis ino* ab. **minor** ♂ (p. 11), *Satyrus semele* ab. **fulvina** ♀ (p. 11), and *Hipocrita jacobaeae* abs. **nigrana** ♀ **and pallens** ♂ (p. 12), Belgium. **F. DERENNE:** *Opisthograptis luteolata* ab. **poskini** (p. 57), Belgium. **HUBERT DEBAUCHE:** *Gonepteryx rhamni* ab. **roseotincta** ♀ (p. 58), Belgium; *Pararge aegeria* v. *egerides* ab. **eutaeniata** (p. 58), "Cortenberg." MEZGER: *Papilio podalirius* ab. **heterotaeniatus** (p. 58), Germany; *Amorpha populi* ab. **flavomaculata** ♀ (p. 59), Holland; *Trachea atriplicis* ab. **epixanthana** ♂ (p. 59) and *Parnassius apollo* ab. **derennei** (p. 59), France; *Samia cynthia* v. **viridis** (p. 60), New York. F. DERENNE: *Erastria fasciana* ab. **ochrea** (p. 78), Belgium. CH. CABEAU: *Melitaea aurinia* ab. **leucophana** ♂ (p. 78) and *Pieris napi* ab. **interjuncta** ♀ (p. 101), Belgium. MEZGER: *Samia cynthia* abs. **bicolorata** (p. 102), **punctata,** and **fenestrella** (p. 103) (loc. not given). **VAN MELLAERTS:** *Craniophora ligustri* ab. **obscura** ♂ (p. 117) and *Abraxas marginata* ab. **semialbata** ♀ (p. 117), Belgium. **F. BRAUN:** *Colias croceus* ab. **fischerii** (p. 117), Belgium; *C. c.* var. *helice* ab. **flavomaculata** (p. 117), France (?). (Vol. 29) **J. CULOT:** *Ematurga atomaria* ab. **mariscolore** (p. 2), Switzerland. F. DERENNE: *Diacrisia mendica* ab. **sabulosa** ♀ (p. 17) and *D. lubricipeda* ab. **unipuncta** ♂ (p. 34), Belgium. H. DEBAUCHE: *Samia cynthia* ab. (or var.) **andrewesi** (p. 65), India; *Vanessa urticae* ab. **flavofasciata** ♂ (p. 66), Belgium; *Anarta myrtilli* ab. **ochrea** ♀ (p. 66) and *Cabera pusaria* ab. **linearia** ♀ (p. 66), "Cortenberg." MEZGER: *Papilio hospiton* ab. **rufopunctata** ♀ (p. 73), Sardinia. F. DERENNE. *Parastichtis monoglypha* ab. **inversa** ♂ (p. 74), Belgium. CH. CABEAU: *Argynnis paphia* ab. **fontainei** (p. 98), Belgium; *Apatura ilia* ab. **subiliades** ♂ (p. 110), Belgium; *A. i.* form *clytie* ab. **deficiens** ♂ (p. 110), Belgium. VAN MELLAERTS: *Colias palaeno* v. *europome belga* ab. **striata** ♂ (p. 123) and *Argynnis lathonia* ab. **pupillata** (p. 123), Belgium; *Melitaea aurelia* ab. **cinerea** (p. 123), "Buzenol." (Vol. 30) CH. CABEAU: *Apatura ilia* ab. **interfracta** ♂* (p. 18), Belgium; *Argynnis selene* abs. **medionigrans*** **and vanescens*** (p. 54), "Botassart-sous-Ucimont" and Belgium; *A. ino* ab. **basinigrans*** (p. 70), Belgium. MEZGER: *Pieris manni* v. est. *rossii* abs. **nigropunctata** ♀ Italy and France, and **binigrata** ♂ Spain and Italy (p. 102). CH. CABEAU: *Melitaea cinxia* ab. **jubilaris** (p. 122) and *Argynnis dia* ab. **posteronubilata** (p. 122), Belgium; *A. aphirape* f. *haverkampfi* ab. **melanira** ♀ (p. 178) and *A. pales* f. *arsilache* ab. **alba** ♀ (p. 178), "Hockai"; *A. aglaja* ab. **ovalis** ♂ (p. 179), "Warchenne." MEZGER: *Papilio machaon* ab. **cellacircinata** ♂ (p. 179), Ural; *Leucochloe daplidice* ab. **conjugata** ♀ (p. 179), France.

17851. [SOKOLOV, G. N.] СОКОЛОВ, Г. Н. **Строение мужского копулятивного аппарата у рода Parnassius Latr. [Structure of male genitalia in the genus Parnassius.]** [German summary.] Русское Энтомологическое Обозрение (*Rev. Russe d'Ent.*) 23(1/2): 60-75. 4 pl. 1929.—The genitalia are described and figured for *Doritis eversmanni, D. mnemosyne, D. stubbendorfi, D. nordmanni, Parnassius apollo, P. nomion, P. nomius, P. discobolus, P. delius, P. apollonius, P. davidis, Koramius delphius, Tadumia tenedius,* and *Kailasius charltonius.*

17852. STEMPFFER, H. Contribution à l'étude de quelques espèces du genre Lycaeides Hubner. *Ann. Soc. Ent. France* 100(1/2): 121-132. 3 pl. 1931.—A critical comparative study of ♂ genitalia and tibiae of: *Lycaeides argyrognomon** and forms *croatica**, *armoricana**, and *bellieri**; *L. insularis** and forms *ligurica**, *euergetes**, and *dschagatai**; *L. cleobis**; *L. melissa**; *L. argus** and forms *carinthiaca**, *cleomenes**, *orientalis**, and *hypochiona**.

17853. STRAND, EMBRIK. Kritische Bemerkungen zu einer neuen Arbeit über afrikanische Teracolus-Arten (Lepidoptera). *Latvijas Univ. Raksti. Ser. 1.* (*Acta Univ. Latviensis*) No. 9. 253-264. 1931.—Critical remarks on C. le Doux's article "Beiträge zur Kenntnis der afrikanischen Teracoliden (Lep. Rhop.)." (Mitt. Zool. Mus. Berlin 15(1): 1-11. 1929.) [See B. A. 6(1): entry 2671.]

17854. TAMS, W. H. T. African Lasiocampidae: a correction, and the description of a new species of Pachypasa. *Ann. and Mag. Nat. Hist.* 8(43): 36-37. 1931.—*P. chaerocampoides* Holland ♂* is distinct from *P. lineata* Auriv.; *P.* papyri* (p. 36), Uganda, type in Brit. Mus.

17855. TOSAWA, NOBUYOSHI. On two new examples of aberrant forms of Papilio sarpedon Linnaeus. [In English and Japanese.] *Trans. Kansai Ent. Soc.* 1. p. (1)-(2). 1 pl. 1930.—*P. sarpedon nipponus* ab. **suzukii** ♂* (p. 1) and *P. s. sarpedonides* ab. **hankyensis** (p. 2), Japan.

17856. TOXOPEUS, L. J. Beschreibung einiger Schmetterlinge (Riodinidae und Lycaenidae) von Pulu Weh bei Sumatra. (Lycaenidae Australasiae V.) *Tijdschr. voor Ent.* 72(3/4): 204-214. 1929.—*Abisara echerius* ssp. **oenobarus** ♀ (p. 205); *Zizina otis* sspp. **parasangra** (p. 206), **kuli** and **annetta** (p. 207); *Acytolepis puspa* ssp. **vandeldeni** (p. 207); *Castalius ethion* ssp. **wehensis** (p. 209); *Nacaduba ancyra* ssp. **hyperpseustis** ♂ (p. 210); *Lampides celeno* ssp. **carolina** (p. 210); *Gerydus biggsi* ssp. **extraneus** ♂ (p. 211); *Amblypodia apidamus* sspp. **anthracophila** ♀ (p. 212), **astrophila** and **ambigua** (p. 212); *Cheritra freja* ssp. **sabanga** (p. 213); *Loxura atymnus* ssp. **intermedius** (p. 214).

17857. TURNER, A. JEFFERIS. Revision of Australian Oenochromidae (Lepidoptera). II. *Proc. Linnean Soc. N. S. Wales* 55(2): 1-40. 1930.—New forms are from W. Australia unless otherwise noted. **BRADYCTENA** (p. 1), near *Dichromodes*, based on *B.* **trychnoptila** (*Dichromodes t.* Turn.); **PHRIXOCOMES** (p. 1), near *Dichromodes*, type *P.* **ptilomacra** (*D. p.* Low) (p. 2); key to spp.; *P.* **nexistriga** (*D. steropias* ab. *n.* Warr.) (p. 2); *P.* **steropias** (*D. s.* Meyr.) (p. 2); *Dichromodes*, key to 58 spp.; *D.* **galactica** ♂ (p. 6), type in coll. G. M. Goldfinch; *D. ainaria* Gn. (=*D. diasemaria* Gm.); *D.* **laetabilis** (p. 7), N. S. Wales, type in Goldfinch coll.; *D.* **aesia** ♂ (p. 8); *D. phaeostropha* Turn. (=*D. obtusata* v. *longidens* Prout); *D.* **oriphoetes** (p. 12), N. S. Wales, type in Goldfinch coll.; *D.* **denticulata** (p. 12), type in author's coll.; *D.* **emplecta** (p. 15), type in W. B. Barnard coll.; *D.* **rostrata** ♀ (p. 15) and *D.* **lissophrica** ♂ (p. 16), types in author's coll.; *D.* **lygrodes** ♀ (p. 18), S. Australia, type in S. Australian Mus.; *D.* **leptogramma** ♀ (p. 18), type in author's coll.; *D.* **limosa** ♂ (p. 19), Queensland, N. S. Wales; *D.* **leptozona** (p. 19), ♂ type in Barnard coll., ♀ in Goldfinch coll.; *D.* **icelodes** (p. 20), N. S. Wales, type in Goldfinch coll.: *D.* **mesodonta** (p. 22); **SYMPHYLISTIS** (p. 25), in *Dichromodes* group, type *S.* **leptocyma** (p. 26), type in Lyell coll.; *Dinophalus* Prout (=*Ophiographa* Prout, *Lissocraspeda* Prout), key to 10 spp.; *D.* **idiocrana** (p. 27), Queensland, N. W. Australia; *D.* **lechriomita** ♂ (p. 29), central Australia, type in S. Australian Mus.; *D.* **cyanorrhaea** (*Hypographa c.* Low) (p. 27); *D.* **eremaea** (*H. e.* Low) (p. 28); *D.* **pygmaea** (*Lissocraspeda p.* Prout) (p. 28); *D.* **serpentaria** (*H. s.* Gn.,=*Eutelia*

undulifera Walk.) (p. 28); *D.* macrophyes (*Ophiographa m.* Prout) (p. 29); *D.* postmarginata (*O. p.* Prout) (p. 30); *D.* dilutaria (*H. d.* Warr.) (p. 30); *D.* drakei (*O. d.* Prout) (p. 31); *Lissomma*, key to spp.; *L.* incongrua (*Agrotis i.* Walk.) (p. 32); *L.* ampycteria (p. 33), type in Goldfinch coll.; *L.* hiracopis (*Hypographa h.* Meyr.=*H. bathroscma* Prout) (p. 33); *L.* atmoscia (*H. a.* Meyr.) (p. 33); *L.* macrodonta (p. 34), S. Australia (type in S. Australian Mus.) and W. Australia; **ENCHOCRANA** (p. 34), near *Dinophalus*, type *E.* lacista ♀ (p. 34), type in author's coll.; *Hypographa*, key to spp.; *H.* epiodes ♂ (p. 35), type in Goldfinch coll.; **MACROCTENIA** (p. 38), near *Monoctenia*, based on *M.* epaeneta ♂ (p. 38), type in Lyell coll.; *Monoctenia*, key to spp.; *M.* postcarneata (*Oenochroma p.* Prout); *M. eximia* Low (=*M. calladelpha* Low); *M. falernaria* Gn. (=*Monoctenia fratenaria* Gn.); *Phallaria ophiusaria* Gn. (=*Oenochroma quaternaria* H. Sch.).

17858. **VERITY, RUGGERO.** Distinzione, nomenclatura e nuove località italiane delle Gegenes nostrodamus F. e pumilio Hoffm. [Distinctions, nomenclature and new Italian localities of G. nostrodamus and G. pumilio.] *Boll. Soc. Ent. Ital.* 63(6/7): 106-112. 3 fig. 1931.—*G. nostrodamus** r. pumilionimima (p. 111), Tuscany and Spain; *G. pumilio**.

17859. **WAGNER, FRITZ.** Dritter (IV.) Beitrag zur Lepidopteren-Fauna Inner-Anatoliens. *Internat. Ent. Zeitschr.* 24(45): 467-474. 1 pl.; (46): 475-485; (47): 487-493. 1931.—An annotated list of spp. is given, 83 being new to central Anatolia, 11 new to Asia Minor, and the following new to science: *Chilades trochilus* ab. supraradiata (p. 472); *Agrotis multangula* ssp. subdissoluta* (p. 474); *A. renigera* ssp. caerulescens (p. 475); *A. vallesiaca* ssp. griseotincta* (p. 476); *Mamestra leucophaea* ab. nigra (p. 476); *Dianthoecia* mayeri (p. 477); *D. tephroleuca* ssp. asiatica (p. 478); *D. gueneei* staudingeri* (p. 479); *Lithocampa* millierei (p. 481); *Cucullia argentina* ssp. grisescens (p. 482); *Hypena antiqualis* ssp. anatolica (p. 484); *Glossotrophia diffinaria* ab. ochrearia (p. 485); *Scodiona conspersaria* ssp. osmanica* (p. 490); *Dyspessa ulula* ab. nigrita* (p. 492).

17860. **WILD, OLIVER H.** Notes on the peculiarities of some Lepidoptera and Hymenoptera from the Inner and Outer Hebrides. *Scottish Nat.* 1931(190): 113-119. 1 col. pl. 1931.—Notes and colored illustrations of: *Argynnis aglaia scotica**; *Epinephele ianira* f. *splendida* (?)* on Canna; *Cidaria concinnata* ssp. oressigena* (Donovan i. litt.) (p. 116), South Uist Isl. and Ireland; *Aporophyla lutulenta* v. *luneburgensis**; *Bombus jonellus* v. hebridensis* (p. 118), Outer Hebrides, type in Royal Scottish Mus.

17861. **WILEMAN, A. E., and R. J. WEST.** Descriptions of new species of Japanese, Formosan and Philippine Noctuidae (Heterocera). *Entomologist* 63(801): 35-38; (802): 62-65; (804): 108-110; (806): 161-163. 1930.—All types are in Brit. Mus. *Enargia* flavata ♂ (p. 35), Hokkaido, Japan; *Pechipogo* discolor ♂ (p. 35), *Mixomelia* arcuata (p. 36), and *M.* angulata ♀ (p. 36), Philippines; *Simplicia* simplicissima ♂ (p. 37), Formosa; *Lysimelia* luzonica ♂ (p. 37) and *Hydrillodes* semiluna (p. 62), Luzon, Philippines; *Bomolocha* nikkensis ♀ (p. 62) and *Hypena* innocua ♂ (p. 63), Honshu, Japan; *H.* variegata ♀ (p. 64), Luzon; *Ophiuche* yoshinalis (p. 64), Honshu; *O.* hokkaidalis ♀ (p. 108), Hokkaido; *O.* interrupta ♀ (p. 108), *Rhynchina* lithinata ♂ (p. 109), *Anoratha* albitibiata ♀ (p. 109), and *Luceria* indigna ♀ (p. 110), all from Luzon; *Hypenagonia* subsuffusata ♀ (p. 161), Formosa; *H.* albiocellata (p. 161), Palawan (type), Mindanao, and Luzon; *Aethalina* plumosa ♂ (p. 162) and *Dichromia* lipara ♂ (p. 163), Luzon.

17862. **WILLIAMS, ROSWELL C. Jr., and ERNEST L. BELL.** Hesperiidae of the Forbes Expedition to Dutch and British Guiana (Lepidoptera). *Trans. Amer. Ent. Soc.* 57(2): 249-287. 34 fig. (11 col.) 1931.—Records are given for 145 spp. and forms, including: *Phocides palemon* ab. gunderi ♂ (p. 251), British Guiana; *Cogia* freudiae ♂* (p. 256), *Entheus* mina* (p. 260), *Atrytone* barbara* (p. 271), and *Euroto* saramacca ♂* (p. 276), Dutch Guiana; *E.* potaro ♂* (p. 277) and *Vehilius* forbesi ♂* (p. 280), British Guiana; *Phanus* godmani ♂* (p. 286), Costa Rica. Types in Acad. Nat. Sci. Phila. The ♂ genitalia are described and illustrated for the above and *Polites dictynna**, *Prenes eugeon**, *Telemiades amphion**, *T. ceramina**, *Lignyostola crinisus**, *Hyalothyrus nitocris**, *Grynopsis coeleste**, *Phanus vitreus**, *P. marshalli**, *Entheus priassus**, *E. gentius**, *Pythonides jovianus**, *P. lerina**, *Achlyodes busirus* f. *negro**, *Gorgythion begga**, *Paramimus scurra* f. *evanescens**, *Charidia lucaria**, *Chiomara punctum**, *Catia ophites**, *Cobalus virbius**, *Phanes almoda**, *P. rezia**, *Phlebodes fartuga**, *P. reticulata**, *Vettius laurea**, and *Thracides hermesia.**

17863. **WOOD, A. A.** A new bait trap for noctuid moths. *Canadian Ent.* 63(7): 149-150. 1931.—Description of a trap in which the bait used was: New Orleans molasses, 1 pint; fermented apple juice, 2 ounces; essence of pear, 10 drops; essence of lavender, 10 drops; essence of anise, 2 drops.

MICROLEPIDOPTERA

CARL HEINRICH, *Editor*

(See also in this issue Entries 15302, 15953, 16782, 16785, 16791, 16792, 16799, 16802, 16814, 16829, 16837, 16849, 17827, 17828, 17839, 17848, 17849, 17859, 18116)

17864. **BALDUF, W. V.** The cycles and habits of Phlyctaenia tertialis (Guenee) (Lepidoptera, Pyralidae). *Proc. Ent. Soc. Washington* 32(2): 31-36. 1930.—Descriptions of egg, larva, pupa and adult, hibernation of larvae and construction of hibernaculum. Data on spring emergence, 1st and 2nd generations, in Illinois and Ohio. The preferred host is the elder, *Sambucus*, the larvae attacking under cover of webbed or rolled leaves.

17865. **BUSCK, AUGUST.** Two new Peruvian Microlepidoptera of economic importance (Gelechiidae and Oecophoridae). *Proc. Ent. Soc. Washington* 33(3): 59-63. 1 pl. 1931.—Gelechiidae: *Gnorimoschema* tuberosella* (p. 59), bred from stalks and tubers of potato, *Solanum tuberosum*. Oecophoridae: *Eucleodora* cocae* (p. 60) does considerable damage to the leaves of coca (*Erytroxylon coca*) amounting to 60% of the harvest in the height of the season. Genitalia, ♂ and ♀, are figured. Types in U. S. Nat. Mus. *Gnorimoschema* (=*Phthorimaea*).

17866. **DUFRANE, ABEL.** Microlépidoptères nouveaux pour la faune belge. *Lambillionea* 30(11): 158-161. 193(
—*Eucosma nisella* abs. *baeberana, rhombifasciana,* an(
siliceana are new to Belgium; *E. n.* ab. brunneana (1
161).

17867. **FILIPJEV, N.** Lepidopterologische Notize(
XIII. Ein neuer Weintraubenschädling aus der Gattun
Ephestia Gn. *Deutsche Ent. Zeitschr. "Iris"* 45(2): 7(
73. 9 fig. 1931.—*Ephestia* vitivora* (p. 70), Transcaucasi
type in Zool. Mus., Leningrad, larvae injurious to grap(
the ♂ and ♀ genitalia* are compared with those of
*elutella**. *Lithocolletis* populi ([*L.*] *populiella* Filip
not Chamb.) (p. 73).

17868. **FORBES, W. T. M., and M. D. LEONAR**
A new leaf-miner of cotton in Porto Rico (Nepticu
gossypii new species). *Jour. Dept. Agric. Porto Rico*
(3): 151-157. 2 pl. 1930.—*N.* gossypii (p. 151), eg
larva*, pupa*, adult*, and leaf mines on cotton* (
scribed; attacks *Gossypium barbadense*. The leaf mi
is widely distributed and infestation is heavy.

17869. **GERASIMOV, A.** Zur Lepidopterenfauna

Mittelasien. III. Neue Lithocolletis. *Ent. Zeitschr.* [*Frankfurt a/M.*] 45(9): 125-132. 5 fig. 1931.—*Lithocolletis* **malella*** (p. 125), leaf miner on *Pirus malus, P. communis, Cydonia vulgaris,* and *Crataegus; L. corylifoliella* ssp. **turanica*** (p. 127), leaf miner on *Cydonia vulgaris* and *Pirus malus; L.* **fainae*** (p. 128), leaf miner on *Salix* and *Populus nigra* (?); *L. connexella* ssp. **asiatica** (p. 130), from *Salix,* Bokhara (type) and Yeniseisk [Siberia]; *L.* **pruinosella*** (p. 130), leaf miner on *Populus pruinosa, P. euphratica,* and *Salix* sp., Bokhara and Khiva. All are from Turkestan, except as noted. Types in author's coll. All figures are of ♂ genitalia.

17870. **JOANNIS, J. de. Bradyrrhoa trapezella Dup. et Bradyrrhoa cinerella Dup. sont des espèces distinctes [Lep. Pyralidae].** *Bull. Soc. Ent. France* 1929(4): 67-73. 1929.—The differences between the 2 spp. are presented in an extended tabular comparison.—*S. B. Fracker.*

17871. **MEER MOHR, J. C. van der. Ein Hypophrictoides-Fund aus Nord-Sumatra.** *Misc. Zool. Sumatrana* 56. 1-2. 1 pl. 1931.—*H. dolichoderella* is myrmecophilous, associated with *Dolichoderus bituberculatus,* and lives in a house* built of frass and excrement, of the shape of an hour glass.

17872. **MEYRICK, EDWARD. Exotic Microlepidoptera.** 3(19): 577-608. August, 1930; 3(20): 609-640. September, 1930. To be obtained from author: Thornhanger, Marlborough, Wilts, England. Pr. 3s. each.—*Hypercallia* **euthyrsa** ♂ (p. 577), Ecuador; *Theatrocopia* Wals., earlier merged by the author in *Cryptolechia,* is now considered distinct after examination of specimens of the type sp. *roseoviridis; Orygocera* **propycnota** ♂ (p. 577), Madagascar; *Epiphractis* **superciliaris** ♀ (p. 577), Sierra Leone; *Cryptolechia* **percnocoma** ♀ (p. 578) and *C.* **sciodeta** ♀ (p. 578), Brazil; *C.* **orthrarcha** ♀ (p. 578), Algeria; **METALLOCRATES** (p. 579), (Blastobasidae) "a development of *Pigritia,*" type *M.* **transformata** ♂ (p. 579), Brazil; *Phyllocnistis synglypta* Meyr., larvae mining leaves of *Terminalia tomentosa; Epicephala* **orientalis** (*Acrocercops orientalis* Stainton,= *A. austeropa* Meyr.); *Acrocercops* **lithochrysa** ♀ (p. 580), Uganda; *A.* **thrylodes** (p. 580), Bombay, larvae mining leaf of *Carissa carandas; A.* **serriformis** (p. 580), Java, larvae mining leaves of *Ricinus communis; Acrocercops astaurota* Meyr., emended description on basis of specimens from Japan, bred from larvae mining in bark of pear tree (*Pyrus communis*); *A.* **lithochalca** ♂ (p. 581), Sikkim; *A.* **astiopa** ♀ (p. 581), Bihar, larvae mining leaves of *Polyalthia longifolia; A.* **crypsigrapha** ♂ (p. 581), Burma; *Gracilaria platycosma* Meyr., bred from larvae rolling leaves of *Litsea glutinosa; G.* **palaearcha** ♀ (p. 582), Fiji; *G.* **citrochrysa** ♂ (p. 582), Bihar, Pusa, bred from cocoons on surface of leaves of *Putranjiva roxburghii; Lithocolletis* **fasciformis** (p. 582), Bihar, bred from larvae mining leaves of *Polygonum glabrum; Epicephala* **scythropis** ♂ (p. 583), Upper Burma, bred from galls on *Phyllanthus; Scoparia* **tricitra** ♀ (p. 583), Dutch New Guinea; *Hypochalcia fuliginella* Dup. (=*H. ghiliani* Staud.); *Aegeria* **astyarcha** ♂ (p. 584), Uganda; **ISOCYLINDRA** (p. 584), (Aegeriidae) based on *I.* **melitosoma** ♂ (p. 584), Uganda; *Paranthrene* **cyanogama** (p. 584), Malaya, bred from larvae boring stem of *Uncaria gambier; Aschistophleps lampropoda* Hamps., notes; *Stathmopoda* **pyrrhogramma** ♀ (p. 585), Cameroons; *Lamprotеucha cassiteris* Meyr., notes; *Tinaegeria* **nephelozyga** ♂ (p. 586), Brazil; *Eretmocera* **homalocrossa** ♂ (p. 586), Uganda; **HIEROPHANES** (p. 586), (Heliodinidae) near *Crembalastis,* based on *H.* **chrysocrana** ♀ (p. 586), Uganda; **GYMNOGELASTIS** (p. 587), (Heliodinidae) type *G.* **miranda** (*Melodryas m.* Meyr.) (p. 587); *G.* **lilitha** ♂ (p. 587), Sudest I.; *Amphithera* **tyriochalca** ♂ (p. 587) and *Meridarchis* **niphoptila** ♂ (p. 588), New Guinea; *M.* **picroscopa** ♂ (p. 588), *M.* **heptaspila** ♀ (p. 589), and *Bondia* **xylinarcha** ♀ (p. 589), British New Guinea; *Copromorpha* **cryptochlora** ♂ (p. 590) and *C.* **mesobactris** (p. 590), Comoro I.; *C.* **myrmecias** ♀ (p. 590), Bihar, bred from larvae boring top-shoots of *Ficus bengalensis; Phalonia* **geniculata** ♂ (p. 591), Assam; *Phtheochroa* **deltochlaena** (p. 591), Bolivia; *Zelleria* **loranthivora** (p. 591), Bihar, bred from larvae boring and feeding on flower-buds of *Loranthus; Nosymna* **macrorrhyncha** ♂ (p. 592), British New Guinea; **BALANOPTICA** (p. 592), (Hyponomeutidae) allied to *Melodryas,* based on *B.* **orbicularis** (*Cyme o.* Feld.) (p. 592), Sumatra; *Melodryas doris* Meyr., ♀ described; *Anaphantis* **zonotorna** (*Melodryas z.* Meyr.) (p. 593); **ASTOXENA** (p. 593), (Hyponomeutidae) allied to *Mieza,* type *A.* **clotho** ♂ (p. 593), French Guiana; *Anticrates* **agrippina** ♀ (p. 594), Celebes; *A.* **magocosma** (p. 594), Dutch New Guinea; *Lactura* **apoplectica** ♂ (p. 594), Solomon I.; *L.* **oroglypta** ♀ (p. 595) *L. coleoxantha* Meyr., ♀ described, and *L.* **erythrodesma** ♂ (p. 595), British New Guinea; *L.* **infervescens** ♀ (p. 596), Trobriand I.; *L.* **rubriflora** ♂ (p. 596) and *L.* **eurypercna** ♂ (p. 597), British New Guinea; *Gymnogramma* **tabulatrix** ♂ (p. 597), Madagascar; **CARMENTINA** (p. 597), (Hyponomeutidae) somewhat related to *Anaphantis,* type *C.* **iridesma** ♀ (p. 598), Solomon I.; **PSEGMATICA** (p. 598), (Eucosmidae) "apparently an abnormal member of the *Eucosma* group," type *P.* **pachnostola** ♂ (p. 598), Fiji; *Acroclita trimelaena* Meyr., emendation; *A.* **ioxanthas** ♂ (p. 599), Cameroons; *Eucosma* **tolerans** ♂ (p. 599), Tibet; *E.* **cremastropis** (p. 599), Uganda, bred from seeds of *Podocarpus; E.* **ioplintha** (p. 600), Sudan, bred "from galls on talh"; **AGRIOPHANES** (p. 600) (Eucosmidae) near *Helictophanes,* type *A.* **pycnostrota** ♀ (p. 600), Madras; *Proschistis* **iricolor** ♀ (p. 601), Dutch New Guinea; *Articolla* **piratodes** ♂ (p. 601), British New Guinea; *Argyroploce* **brevisecta** ♂ (p. 601), Benin; *A.* **thermopetra** ♂ (p. 602), Cameroons; *A.* **atricapsis** ♀ (p. 602), Nigeria; *A.* **tornophanes** ♀ (p. 603), Solomon I.; *A.* **platymolybdis** ♀ (p. 603), Cameroons; *A.* **molybdachtha** ♀ (p. 603), Ivory Coast; *A.* **atmochlora** (p. 603), Java, bred from larvae rolling leaves of *Cinnamomum camphora; A. purpurissitana* Kenn., bred from larvae in spun leaves of *Litsea glutinosa; Laspeyresia* **staphiditis** (p. 604), Bihar, bred from larvae boring twigs of *Bauhinia purpurea; L.* **spumans** ♂ (p. 605), Cameroons; *L.* **aeolornis** ♀ (p. 605), Bismarck I.; *Homona* **capnobathra** ♂ (p. 605), Madagascar; *Pseudatteria* **igniflora** ♀ (p. 606), Bolivia; *P.* **symplacota** ♀ (p. 606), Ecuador; *P.* **orgias** ♀ (p. 607) and *P.* **xanthocapna** ♂ (p. 607), Colombia; *P.* **myriocosma** ♀ (p. 608), Bolivia; *Tortrix* **eurymenes** ♀ (p. 608), Dutch New Guinea; *T.* **oriphanes** ♂ (p. 608), Peru; *T.* **apochranta** ♂ (p. 609), Brazil; *T.* **endopyrrha** ♂ (p. 609), Uganda; *Xenothictis* **atriflora** ♂ (p. 609), Fiji; *Eulia* **homosacta** ♂ (p. 610) and *Paraptila* **hydrochoa** ♂ (p. 610), Ecuador; *Schoenotenes* **octosticta** ♂ (p. 610), British New Guinea; **LOPHOPRORA** (p. 611), (Tortricidae) allied to *Spatalistis,* type *L.* **cyanostacta** ♂ (p. 611), British New Guinea; *Spatalistis* **droserantha** ♀ (p. 611), Assam; *Sparganothis* **elimata** ♂ (p. 611), Ecuador; *Argyrotoxa* **venatrix** ♂ (p. 612) and *A.* **erythrocyma** ♀ (p. 612), Cameroons; *Peronea* **ulmicola** ♀ (p. 612) and *P.* **tephromorpha** ♂ (p. 613), Manchuria, bred from larvae rolling leaf of *Ulmus;* **ANTIGRAPTIS** (p. 613), (Tortricidae) allied to *Peronea* and *Mictoneura,* type *A.* **hemicrates** ♀ (p. 613), Dutch New Guinea; *Cacoecia* **concavata** ♂ (p. 614), Peru; *Macrobathra* **neurocoma** ♂ (p. 614), Cameroons; *M.* **antimeloda** ♂ (p. 614), Madagascar; *Promalactis* **isothea** (p. 615), Madras; **ALOMENARCHA** (p. 615), (Oecophoridae) "a development of *Dasycera,*" type *A.* **phalarista** (p. 615), Silhet; *Cyphothyris ophryodes* Meyr., emendation; *Allotalanta* **ochthotoma** (p. 616) and *A.* **tephroclystis** ♂ (p. 616), Cameroons; *Piloprepes* **phthoromima** ♂ (p. 617), British New Guinea; **PYROPHRACTIS** (p. 617) (Oecophoridae), allied to *Machimia,* type *P.* **isotherma** ♀ (p. 617), British New Guinea; **EPIMORYCTIS** (p. 618), (Oecophoridae) "a development of *Machimia,*" type *E.* **percnorma** ♂ (p. 618), Brazil; *Machimia* **elaphodes** ♂ (p. 618), Bolivia; *Syscalma* **prymnaea** (p. 619), British New Guinea; *Barantola panarista* Turn. and *B. pulcherrima* Walk.,

notes on New Guinea specimens; *Scorpiopsis* **exanthistis** ♂ (p. 619), British New Guinea; *S.* **diplaneta** ♂ (p. 619), British and Dutch New Guinea; *S.* **rhodoglauca** ♂ (p. 620), Queensland; *Octasphales* **niphadosticha** ♀ (p. 620), British New Guinea; *Depressaria* **nyctalopis** ♀ (p. 621), Comoro I.; *Hypercallia* **deflorescens** (p. 621), Sikkim; *Diocosma* **rhodopola** ♂ (p. 621), Kenya; *Calliphractis phyllograpta* Meyr., ♂ described, *Orygocera* **liliacea** ♂ (p. 622), and *O.* **amphichelota** ♂ (p. 622), Cameroons; *O.* (?) **magdalena** ♀ (p. 622), Madagascar; *Melconoma* **nephospora** ♂ (p. 623), Sikkim; *Periacma* **delophanta** ♀ (p. 623), Madras; **CRITOXENA** (p. 623), (Oecophoridae) allied to *Scalideutis*, type *C.* **agraphopis** ♀ (p. 624), India Central Provinces; **CATOLBISTIS** (p. 624), (Lampronidae) type *C.* **thrasymedes** ♂ (p. 624), Uganda; *Nemotois* **xanthophracta** ♂ (p. 624), Bombay; *N. ischnodesma* Meyr., ♂ described, Burma; *N.* **porphyraspis** ♀ (p. 625), Kenya; *Coleophora* **summivola** ♂ (p. 625), *C.* **nivifera** ♂ (p. 625), and *Epermenia* **sublimicola** (p. 626), Tibet; *E.* **parasitica** ♂ (p. 626), Java. A generic and specific index concludes the volume.

17873. SUIRE, JEAN. Une espèce nouvelle de Coléophore. Coleophora joannisella, n. sp., et ses premiers états. *Bull. Soc. Ent. France* 1930 (2) : 25-29. 1 fig. 1930. —*C. joannisella** (p. 27), Herault, reared on *Dorycnium suffructicosum*.—*S. B. Fracker.*

17874. THORPE, W. H. Further notes on biological races in Hyponomeuta padella (Linn.). *Proc. Linnean Soc. London* No. 142. 27-28. 1929/30 (1931).—*H. padella* splits up into distinct races, one on apple, one on *Crataegus oxyacantha*, and one on *Prunus spinosa.*

NEUROPTEROIDS

(See also in B. A. 6(5): Entries 14670, 14677; and in this issue 17470, 17472, 17473, 18116)

17875. [ARTOBOLEVSKII, G. V.] АРТОБОЛЕВСКИЙ, Г. В. Стрекозы Дагестана. [Odonata of Daghestan.] Русское Энтомологическое Обозрение (*Rev. Russe d'Ent.*) 23 (3/4) : 225-240. 1929.—An annotated list of 32 spp. is given. Geographic distribution of 57 spp. in Daghestan, Kuban, central Ciscaucasia, and the former Stavropol government is added.

17876. BARTENEF, A. N. Über die Aberrationen von Libellula quadrimaculata L. (Odonata). *Zool. Anz.* 87 (7/8) : 191-198. 1930.—A series of 87 specimens (8 ♂♂, 79 ♀♀) from the marshes of Atchuyev on the Sea of Azov belonged to the aberration *praenubila*, except 4 of each sex of the typical form and 2 ♀♀ of ab. **contacta** (p. 192), descriptions of which are given. The new aberration is a transitional form between ab. *praenubila* and ab. *dittrichi*. A detailed analysis of the variations in wing pattern of ab. *praenubila* showed certain correlations between the length and breadth of the spots. *Praenubila* is an atavistic form which is disappearing. A key is given for separating the 5 aberrations of *L. quadrimaculata* as recognized by the author. This is followed by a list of 11 additional spp. received from the above mentioned locality.—*E. M. Walker.*

Each sp. is described, with synonymy, distribution, and such biological data as are known. Panorpidae: **BRACHYPANORPA** (p. 209), type *B.* **carolinensis*** (*Panorpodes c.* Banks) (p. 211), key to spp.; *B.* **oregonensis*** (*P. o.* MacLachlan) (p. 211); *B.* **montana** (p. 212), Oregon, 8-9000 ft.; *Panorpa*, a review of the generic characteristics, biological and morphological, keys to ♂♂ and ♀♀ of spp. including *Panorpa* **mirabilis*** (p. 229), New Jersey (type, in U. S. Nat. Mus.), New York, Pennsylvania, Michigan; *P.* **longicornis*** (p. 231), Tennessee (type) and N. Carolina; *P.* **modesta*** (p. 233), Michigan; *P.* **eloborata*** (p. 239), Virginia (type), New York, Connecticut, New Jersey, Pennsylvania, Maryland, N. Carolina, S. Carolina, and Ohio; *P.* **robusta*** (p. 240), S. Carolina; *P.* **isolata*** (p. 241), Georgia (type), N. Carolina, Tennessee, and S. Carolina; *P.* **neglecta*** (p. 242), Alabama; *P.* **braueri*** (p. 242), Arkansas; *P.* **speciosa** ♂* (p. 243), Illinois (type, in Field Mus.) and Minnesota; *P.* **dubitans** ♂* (p. 243), Indiana, type in Field Mus.; *P.* **decorata*** (p. 245), Pennsylvania; *P.* **anomala*** (p. 245), Kansas; *P.* **dissimilis*** (p. 246), Virginia (type), New Jersey, and New York; *P.* **proximata*** (p. 247), Arkansas; *P.* **gracilis*** (p. 247), N. Carolina; *P.* **sigmoides*** (p. 250), Indiana (type, in Illinois State Nat. Hist. Mus.) and Illinois; *P.* **chelata*** (p. 251), Massachusetts (type), Connecticut, New York, N. Carolina, Georgia, Michigan, and Illinois; *P.* **acuta*** (p. 253), Tennessee (type), New Hampshire, Massachusetts, Connecticut, New York, New Jersey, West Virginia, N. Carolina; *P.* **submaculosa*** (p. 255), Michigan (type, in Mus. of Zool. Univ. Mich.) and New York. *Bittacus*, key to spp.; *Apterobittacus*, redescribed; *Boreus*, key to spp. The bibliography contains 58 references. The types, unless otherwise designated, are in the Mus. Comp. Zool.

17879. DALLMAN, A. A. Dragon-flies in the outer Hebrides. *North Western Naturalist* 6 (4) : 229. 1931.—List, in which *Sympetrum scoticum* and *Agrion puella* are additions.

17880. DESPAX, R. Observation relative à l'action de la lumière sur la métamorphose des Trichoptères. *Bull. Soc. Ent. France* 1928 (9) : 154-156. 1928.—Light does not hinder the emergence of the adults of *Limnophilus bipunctatus* as it does those of *Stenophylax luctuosus*.—*S. B. Fracker.*

17881. GORTER, F. J. Köcherbauversuche an Trichopterenlarven. *Zeitschr. Wiss. Biol. Abt. A. Zeitschr. Morph. u. Ökol. Tiere* 20 (2/3) : 443-532. 1931.—Case-building was examined in 11 species of Limnophilidae and in 2 spp. of Leptoceridae. If removed from their cases, the larvae usually build new ones. Based on these experiments, the following data were obtained: (1) The larvae (except those of *Enoicyla pusilla*, which live on land) first made a provisional sheath and then added a permanent one; (2) almost every species used more than half of the kinds of material provided for the building of their provisional and definitive cases; and (3) there developed a gradual selective preference for certain materials, as previously noted by Bierens de Haan. For the larvae of *Limnophilus flavicornis, L. rhombicus*, and *Anabolia nervosa* average series of preferences were drawn up, one for the provisional and one for the permanent structures, and they were also compared.—*F. J. Gorter.*

17882. HUBAULT, Ét. A propos de l'action de la lumière sur la métamorphose des Trichoptères. *Bull. Soc. Ent. France* 1928 (12) : 198-199. 1928.—Negative phototropism is not closely correlated with torrenticolous habits in Diptera and Trichoptera.—*S. B. Fracker.*

17883. LACROIX, J. L. Notes sur les Chrysopides. *Bull. Soc. Ent. France* 1931 (11) : 173-174. 1931.—*Chrysopa vulgaris* Schn. is apparently distinct from *C. carnea* Steph.—*S. B. Fracker.*

17884. LESTAGE, J. A. Les pseudo Hexagenia de la faune éthopienne. (Ephemeroptera.) *Bull. et Ann. Soc. Ent. Belgique* 71 (1/2) : 39-40. 1931.—There is only 1 ephemerid in the Ethiopian region, *Eatonica schouteden* Nav. (=*Hexagenia illustrus* Eaton, *H. fulva* Esben Petersen, *H. reticulata* Nav., *Ephemera nimia* Nav.).

A list of the Odonata of British Somaliland and a description of a new species of the genus Enallagma. *Entomologist* [*London*] 64 (823): 274-278. 2 fig. 1931.—A list of 11 Libellulidae, 3 Aeshnidae, 4 Agrionidae, including *Enallagma* **somalicum** ♂ (p. 277); type in Brit. Mus.

17889. LUCAS, W. J. Notes on the British Neuroptera and Mecoptera in 1930. *Entomologist* [*London*] 64(822): 243-244. 1931.—Collecting notes on 2 spp. of Sialidae, 2 Rhaphidiidae, 4 Coniopterygidae, 1 Sisyridae, 10 Hemerobiidae, 5 Chrysopidae, and 2 Panorpidae.

17890. LUCAS, WILLIAM JOHN. The aquatic (naiad) stage of the British dragonflies (Paraneuroptera). (Ray Soc. Ser. No. 117) 132p. 35 pl. (12 col.), 30 fig. 1930. Pr. 25 s.—The book gives a general account of a dragonfly naiad and its life-story, followed by identification tables, and descriptions of the British species. Of these (42 in number) 32 are figured, magnified, in colors or sepia (with details), each on a separate plate. The rest, except *Sympetrum vulgatum* Linn., *S. jonscolombei* Selys, and *Ischnura pumilio* Charp., are illustrated in the text.—*W. J. Lucas.*

17891. McDUNNOUGH, J. The eastern North American species of the genus Ephemerella and their nymphs (Ephemeroptera). *Canadian Ent.* 63(8): 187-197. 1 pl.; (9): 201-216. 3 pl. 1931.—*Ephemerella,* key to spp. of nymphs; *E. dorothea,* nymph*; *E. subvaria,* nymph*; *E. rotunda* ♂*, nymph*; *E. invaria,* nymph*; *E. aurivilii,* nymph*; *E. septentrionalis,* first description of nymph*, subimago and ♀, and ♂ redescribed; *E. needhami,* ♀ first description, ♂ is redescribed, subimago, nymph*; *E. deficiens,* nymph*; *E. sordida* ♂*, nymph*; *E. serrata,* nymph*; *E. serratoides,* ♂ genitalia*, nymph*; *E. simplex,* ♂ genitalia*, nymph*; *E. attenuata* ♂ genitalia*, nymph*; *E. margarita,* nymph*; *E. lata,* ♂ genitalia*, nymph*; *E. cornutella,* ♂ genitalia*, nymph*; *E. cornuta,* ♂ genitalia*, nymph*, and redescription of subimago; *E. tuberculata,* nymph*, first description of subimago, ♂* and ♀; *E. fuscata,* ♂ genitalia*, nymph*.

17892. MILNE, LORUS J. Three new Canadian Prophryganea. (Phryganeidae, Trichoptera.) *Canadian Ent.* 63(10): 228-232. 2 pl. 1931.—*Phryganea* **sayi** (*P. interrupta* Say preocc.) (p. 228); *Prophryganea* **macdunnoughi** ♂* (p. 230), Alberta; *P.* **deflata** ♂* (p. 230), Saskatchewan; *P.* **bradorata*** (p. 230), Quebec (type), Manitoba, Alberta, and Saskatchewan. The ♂ genitalia for all 3, and the ♀ genitalia of *P. bradorata,* and 2 undetermined spp. are figured. Types in Canadian Nat. Coll.

17893. MOSELY, MARTIN E. The Trichoptera of the British Isles. In: **Contrib. á l'étude du peuplement des îles Britanniques; Mem. Soc. Biogéogr.** 3. Pp 67-75. 1930.—A list with notes on distribution.

17894. NAVÁS, LONGIN[OS]. Insectes névroptères et voisins de Barbarie. Huitième série. *Bull. Soc. Hist. Nat. Afrique du Nord* 20(8): 227-230. 3 fig. 1929.—A record of 13 spp. including.—Neuroptera: *Macronemurus* **hedigeri** ♂* (p. 227), Morocco, type in Bâle. Mus. *Plecoptera, Isoperla* **lecerfi*** (p. 229) and *Nemura* **talboti*** (p. 230), Algeria, types in Paris Mus.

17895. NAVÁS, LONGINOS. Insectos del Brasil. 4.ª serie. *Rev. Mus. Paulista* [*São Paulo*] 17(1): 455-458. 3 fig. 1931.—Neuroptera, Ascalaphidae: A record of *Ululodes cajennensis* from Argentina. Ephemeroptera, Polymitarcidae: *Compsurus* **longicauda** ♂* (p. 455), Brazil; *C.* **pfeineri** ♂* (p. 457), Argentina. Trichoptera, Calamoceridae: *Phylloicus* **obliquus** ♀* (p. 458), Minas Geraes, Brazil. Types in Deutsch. Ent. Mus. Berlin-Dahlem.

17896. NEVIN, F. REESE. Larval development of Sympetrum vicinum (Odonata: Libellulidae; Sympetrini). *Trans. Amer. Ent. Soc.* 55(2): 79-102. 1929.—Eggs of *S. vicinum* collected on Oct. 1, 1927 began hatching Nov. 28. Each larva was kept in a stender dish at about 21 C. and fed first with *Paramecium caudatum,* stylonychias, a few vorticellas and later with ostracods, copepods including *Cyclops* and *Diaptomus, Daphnia, Hyallela* and small mayfly and stonefly nymphs. Four individuals passing the 3rd instar, lived through the 11th and transformed or died during transformation. Length of instars varied from 2 days to nearly a month. No correlation exists between individuals in length of instars except in the 1st and last which were longer. Adults appeared more than a month earlier than before recorded. A growth curve for one larva is included. Each exuvia and dead larva was preserved in alcohol for study. Constant characters were: Movable hook, long and slender; hair-like setae on vertex and ventral surface of 9th abdominal segment; antennae and legs brown-banded, the shade varying individually and in different instars; abdomen in later instars noticeably flattened on ventral surface. The following changes in characters were noted: The horns on vertex increased in length in first 2 instars, but disappeared after the 8th or 9th; antennae, at first 3-segmented, become 7-jointed in 7th instar; the width of mentum is at first greater than the length, later it is equal to it; lateral setae increase from 1 to 9; no mental setae in first, but 11 in last; denticles appear on mandibles in later instars; the proximal mandibular teeth increase in number; wing-pads are discernible in 5th instar and cover 5 or 6 abdominal segments in 11th instar; tarsal joints increase from 1 in first 3 instars to 3 in the 7th; the lateral spines on segment 9 appear in 5th instar, on both 8th and 9th after the 6th instar; lateral spines are brown tipped in last 2 instars; lateral keels are present on segment 7 in 7th instar and from 4 to 7 in 9th. Dorsal hooks appear on segments 6, 7, and 8 in 5th instar and on 4-8 inclusive in 7th and following instars.—*F. R. Nevin.*

Zeitung* 92(2): 266-274. 13 fig. 1931.—Plecoptera: *Diamphipnoa* rediagnosed, key to spp.; *D. virescentipennis,* egg*, ♂*, ♀*, redescribed; *D. annulata* (Brauer) (=*D. lichenalis* Gerstaecker), ♂* ♀*, redescribed.

17900. TILLYARD, R. J. On a collection of stoneflies (order Perlaria) from South Africa. *Ann. South African Mus.* 30(1): 109-130. 13 fig. 1931.—Nemouridae (=Leuctridae); the author places *Leuctra* in the subfam. Nemourinae, and does not consider it worthy of subfamily or family rank. Notes on venational nomen-

clature in the order are given. Perlidae: *Ochthopetina transvaalensis**, descriptive notes. Nemouridae: **APHANICERCA** (p. 117), type *A.* capensis* (p. 119); *A.* denticulata* (p. 121); **APHANICERCELLA** (p. 124), new subg. in *Aphanicerca*, type *A.* (*Aphanicercella*) barnardi* (p. 122); **DESMONEMOURA** (p. 126), near *Aphanicerca*, type *D.* pulchellum* (p. 126). All from Cape Province, types in S. African Mus. Two unidentified larvae* are briefly described.

17901. **TILLYARD, R. J. The larva of Hemiphlebia mirabilis Selys (Odonata).** *Proc. Linnean Soc. New South Wales* 53(3): 193-206. 13 fig. 1928.—This minute dragonfly is confined to Australia, where it is known from only 2 localities: Port Denison (Bowen), Queensland, and Alexandra, Victoria. A sketch of previous work published upon it is given. In November 1927, the hitherto unknown larva was found in a backwater of the Goulburn River, near Alexandra. Its limited distribution in this area is suggested as due to the periodical droughts drying up all the rest of the high backwaters except at a rather deep hole between the clumps of reeds and this serves as a reservoir for the larvae when no other water is available. Most of the 50, dark brown, sluggish larvae obtained were clinging closely to the lower, dirty brownish portions of the stems of *Myriophyllum* and to the bases of the stems of reeds and submerged grasses. A detailed description of the exterior (including the larval wing-tracheation), rectum, and gizzard* is given, followed by a general discussion of the larval characters. Characters held to be unique within the Odonata are the trifid hypopharynx, presence of both glossae and paraglossae, incomplete wing-tracheation and the origin of tracheae Sc, R1 and Rs+M from a short common stalk. Characters shared with the Synlestidae, Lestidae, Epallagidae, Polythoridae and Coenagriidae (Agrioninae of de Selys) are listed. Conclusions are that the larva of *Hemiphlebia* is an exceedingly archaic type, probably by far the most archaic larval type of Odonata still existing; it shows a closer relationship with the larval forms of the Plectoptera than might reasonably be expected, indicating a common ancestor very far back; it shows a very close relationship with the Synlestidae and Lestidae, and is properly to be placed close to these 2 families in any scheme of classification. The erection of the family Hemiphlebiidae (Kennedy 1920) appears to be more than justified on the larval characters alone, and the family may legitimately be regarded as a remnant of an exceedingly early type of Zygoptera and not really very far removed from the original types (now lost) which gave origin to all the greater groups of Odonata.—*P. P. Calvert.*

Tiere* 7(4): 609-642. 1 col. pl., 1 fig. 1927.

17905. **GRASSÉ, PIERRE P. Étude ecologique et biogéographique sur les Orthoptères français.** *Bull. Biol. France et Belgique* 63(4): 489-539. 1929.—The term "association" as used by ecologists is considered an unhappy one as it implies finality. The term "group" is suggested, and defined as a collection of species, more or less stable, meeting the same exigencies in the same medium. Morse Researches on N. Amer. Acrididae (1904), distinguished 2 sorts of acridiens, the "geophiles" (earth-lovers), and the "phytophiles" (leaf-lovers), and for each of these created the "open-fields" forms, and the "woods" forms, divided in turn into the "xerophiles" and "hygrophiles," (favoring dryness or moisture). Vestal's groups (1913) are somewhat the same. The author submits the following: Sylvicoles, pratincoles, saxicoles and arénicoles, dwellers in woods, meadows, rocky ground, and sandy soil. The species dominating in the sylvicole group depends upon the type of woods dominating the area, whether leafy (oaks etc.) or pines; that dominating in the pratincole group depends upon whether the prairies are dry, swampy, cut over, or pasturage; that dominating the saxicole depends upon the composition of the dry area, whether fallen land, land meager of vegetation, disintegrated debris, denuded land, etc.; and that dominating the arénicole depends upon the condition of the area, dry dunes, salty sand, hazards to ovipositing, etc. In the formation of groups certain physical features have a preponderant influence, —humidity, evaporation, wind (by favoring evaporation), underbrush (by conserving moisture), temperature, limits of light, nature of soil (with reference to whether it retains or gives up heat and moisture readily, thus favoring or disfavoring ovipositing). The "group" is only exceptionally dependent upon a determined vegetation (only as this creates a favorable atmosphere, or climatic condition). Localities having different plant associations but having in common certain characteristics of humidity, light, temp., movements of the air, etc. become suitable for analogous groups of Orthoptera. "Groups" make and unmake themselves perpetually according to the causes effective in establishing them and the season of the year. The ensemble of a group is not permanent. It has however a biological value in giving an idea of the characteristic of the medium. The influence of radiation, terrestrial magnetism, etc. is unknown and baffling. The faculty of accommodation differs in species, some being tolerant to much wider limits of change than others. The composition of the French orthopteran fauna and geographic affinities of species are discussed.—*I. McCracken.*

17910. KING, HAROLD H. The desert locust, Schistocerca gregaria, Forsk. *Wellcome Trop. Res. Lab., Ent. Sect. Bull.* 30. 1-12. Map. 1930.—There are 3 spp. of gregarious migratory locusts in the Sudan: *Locusta migratoria, Anacridium moestum* v. *melanorhodon,* and *Schistocerca gregaria.* The first, or European locust, is occasionally met with on the Red Sea littoral during the winter months; the second is a tree locust. Neither of these is a major pest. The last is a periodic plague locust, and ranges from the Punjab to Senegal and southward to Tanganyika and South West Africa. It has solitary, transient, and gregarian forms, which may give rise one to the other under suitable conditions, not yet understood. Complete development requires about 45 days. In migrating they fly at such heights and to such great distances that it is not always easy to locate their origin. Various control measures are discussed, but the favored method is the use of poisoned baits.

17911. REMY, P. Observations sur les moeurs de quelques Orthoptères cavernicoles. *Ann. Sci. Nat. Zool.* 14 (2): 263-274. 1931.—Phasgonuridae: Notes on the habits of the cave-dwelling spp., *Troglophilus cavicola, T. neglectus, Dolichopoda linderi, Tachycines cuenoti,* and *Diestrammena* sp. Examinations were made of the digestive tubes of several specimens of each to determine the nature of the food. They were all found to be zoophagous and phytophagous, feeding on plant matter, fungi, and insects.

17924. **ALLEN, MORROW J.** A new record of the cusk eel, Otophidium welshi Nichols and Breeder. *Copeia* 1931(1): 28. 1931.—Off the Louisiana coast.

17925. **AMEMIYA, IKUSAKU, and HIROSI NAKAMURA.** On the sexual dimorphism exhibited in rigor mortis in a fish, Hypomesus olidus (Pallas). *Japanese Jour. Zool.* 3(5): 299-303. 7 fig. 1931.—Description of the sexual difference which becomes apparent only in rigor mortis is given. The males have their mouths wide open (often abnormally wide), the ♀♀ entirely or nearly closed. The fins of the ♂ are more erect and more stretched than in the ♀. The whole musculature of the ♂ is stiffer than that of the ♀. The dimorphism is intimately related to the spawning season and observable only in fishes with fully developed gonads; in the growth period it is not apparent. The dimorphism may be due to the different grades either of the tonus or the development of muscles relating to the opening of the mouth and the erecting of the fins and their antagonists. —*I. A. Amemiya.*

17926. **AMEMIYA, IKUSAKU, and SABURO MURAYAMA.** Some remarks on the existence of developing embryos in the body of an oviparous cyprinodont, Oryzias latipes (Temminck et Schlegel). *Proc. Imp. Acad.* [*Tokyo*] 7(4): 176-178. 1 fig. 1931.—Fertilization and egg development normally occur outside of the body. Very rarely internal fertilization takes place and embryogenesis proceeds to some extent within the parent body. Several features with respect to habit and behavior in spawning and the nature of the egg seem to indicate that the fish, although normally oviparous, is transitional between oviparous and viviparous cyprinodonts. As the fish is much used for genetic studies, the attention of geneticists is called to these facts lest the internal embryos be overlooked.—*I. Amemiya.*

17927. **AWERINZEW, S., und NATHALIE SSYTSCH-AWERINZEWA.** Über Clupeiden des Kaspischen Meeres. *Zool. Anz.* 85(3/4): 99-105. 1929.—One month in the spring of 1929 was spent in the study of migrations and races of the 8 spp. of *Caspialosa* (closely related to *Alosa*) recognized from the northern and middle parts of the Caspian Sea. Brief statements of the distribution and places of spawning are given for the several species. Results are given of the study of 500 specimens for specific and racial characters. Vertebrae counts, particularly the caudal vertebrae, and scale counts in certain sections of the body were found useful in distinguishing species and races.—*S. F. Hildebrand.*

17928. **[BELÍAEV, V.] БЕЛЯЕВ, В.** Abramis sapa bergi subs. nova. Подвид белоглазки из южного Каспия. [A new subsp. of A. sapa from the southern Caspian.] [English summary.] Известия Бакинской Ихтиологической Лаборатории (*Bull. Baku Ichthyol. Lab.*) 2(2): 80-98. 1929.—*A. s.* bergi (p. 80). For spawning, it ascends the rivers (chiefly the Kura, in Transcaucasia) during the winter, at water temp. of 5°-10°. The annual catch of the fisheries is 1 to 2 million fish.

17929. **BORODIN, N. A.** Atlantic deep-sea fishes. *Bull. Mus. Comp. Zool. Harvard Coll.* 72(3): 55-89. 5 pl., 1 fig. 1931.—An annotated list of about 63 spp. obtained by C. O. Iselin and associates during 2 cruises in the N. Atlantic in 1928 and 1929, chiefly at depths of 900-1500 m. Descriptive, taxonomic, and distributional notes are given. Alepocephalidae: *Aleposomus cyaneus** Zug., emended description. Maurolicidae: *Ichthyococcus ovatus** (Cocco), emended description; *Zaphotias* J. & E., emended diagnosis. Myctophidae: *Lampanyctus niger* (Günther) (=*Nannobrachium macdonaldi* Goode & Bean). Odontostomatidae: *Odontostomus balbo* atlanticus (p. 78), type in Mus. Comp. Zoöl. Bibliography.

17930. **BUEN, FERNANDO de.** Sur une collection de Gobiinae provenant du Maroc. Essai de synopsis des espèces de l'Europe. *Bull. Soc. Sci. Nat. Maroc* 10(7/9): 120-147. 12 fig. 1930.—*Lesueuria sanzoi**, *Gobius cobitis*, *G. paganellus**, and *G. niger* are recorded from French Morocco.—The author reviews the Gobiinae of Europe and N. Africa, giving keys to the genera, subgenera, and spp. Iljin's genera *Engrauligobius*, *Bubyr*, and *Knipowitschia* are reduced to subgeneric rank under *Pomatoschistus* Gill; **NINNIA** (p. 130), n. subg. of *Pomatoschistus*, type *Gobius canestrini** Ninni; **ILJINIA** (p.

130), n. subg. of *Pomatoschistus,* type *Gobius microps** Kröyer; **ZEBRUS** (p. 135), n. subg. of *Gobius,* type *G. zebrus** Risso; **CHROMOGOBIUS** (p. 135), n. subg. of *Gobius,* type *G. quadrivittatus* Steind.; **MACROGOBIUS** (p. 135), n. subg. of *Gobius,* type *G. cobitis* Pallas. Extensive bibliography.

17931. BULMAN, O. M. B. On the general morphology of the anaspid, Lasanius Traquair. *Ann. and Mag. Nat. Hist.* 6(33): 354-362. 4 fig. 1930.—The bases of the post-cephalic rods were inclined forward to conform with the V-ing of the myotomes; the extremities of the basal plates of these rods, the ascending processes of which likely had an inclination of about 45°, were probably connected by a ligament or cartilage. The ventral surface probably became more flattened from the anterior end of the trunk to the postulated anal fin, the body in the posterior region being in all likelihood extremely flattened. The caudal peduncle was probably lenticular in section. The branchial ossicles, the ascending spines of which were possibly spaced parallel to one another and myoseptal in position, appear to have been united in life by ligaments or cartilage. The branchial band was probably inclined at about 45°. The post-cephalic rods lying behind the branchial region and apparently homologous with the pectoral girdle of more advanced forms, functioned primarily as means of protection of the branchial region from the musculature, and at the same time perhaps gave support secondarily to the "pectoral fin," which was probably not capable of movement. The caudal fin rays were relatively broad and not rigid; there was some widening distally but no increase in number by interpolation. The present reconstruction of *Lasanius* shows a body somewhat similar to that of the Osteostraci. Evidence of scales is imperfect.—*J. H. Wales.*

17932. BULMAN, O. M. B. Note on Palaeospondylus gunni Traquair. *Ann. and Mag. Nat. Hist.* 8(44): 179-190. 1 pl., 5 fig. 1931.—Detailed description of skeleton with drawings of material and reconstructions. The present investigation agrees mainly with Stensiö that *Palaeospondylus* has advanced along the pteraspidomorph line toward *Myxine* further than hitherto suspected. Posterior situation of gill-pouches, probably a rasping tongue, marked reduction of dermal ossification, and probably 2 semicircular canals are noteworthy characters of this organism. Possibly the resemblance between the Devonian *Palaeospondylus* and living myxinoids is due somewhat to adaptive convergence and not that *Palaeospondylus* stands in the direct line of descent of modern forms.—*J. H. Wales.*

17933. CHU, YUANTING T. Index piscium sinensium. *Biol. Bull. St. John's Univ.* [*Shanghai*] 1. i-iv+1-291. 1931.—This work aims to bring together the widely scattered data on the fishes of China. It includes 1533 spp. and subspp., representing 213 families and 592 genera. There is a brief synonymy for most of the forms, and descriptive and taxonomic notes are given for some of them. Distributional data are supplied, with references to the authorities for the records. Cyprinidae: *Opsariichthys bidens* Gunther (=*O. chekianensis* Shaw); *Culter dabryi* Blkr. is removed from the synonymy of *C. recurviceps* (Rich.). An extensive bibliography and an index to technical names are added.

17934. FOWLER, HENRY W. A synopsis of the fishes of China. Part II concluded. The herrings and related fishes. *Hong Kong Naturalist* 2(3): 198-208. 8 fig. 1931. —The present part treats 17 spp. of Engraulidae.

17935. FOWLER, HENRY W. A small collection of fishes from Singapore. *Proc. Acad. Nat. Sci. Philadelphia* 83: 443-448. 1 fig. 1931.—A list of 52 spp., with locality records, descriptive notes, and Malay names of some spp. Sciaenidae: *Johnius* **birtwistlei*** (p. 446), from market, Singapore, type in Acad. Nat. Sci. Philadelphia.

17936. GAETANI, D. de. Uova, sviluppo embrionale e stadi post-embrionali negli Sparidi. 1. Oblata melanura Cuv. [Eggs, embryonal development and postembryonal stages in Sparidi.] *R. Comitato Talassografico Italiano, Mem.* 183. 18p. 1 pl. 1931.—*O. melanura**, description of developmental stages.

17937. GREELEY, J. R. Fishes of the Lake Champlain watershed. *New York State Dept. Conserv. Suppl. to 19th Ann. Rept.* p. 44-87. 16 col. pl., 5 fig. 1929(1930). —Data are given on distribution of species, relative numbers and economic importance of each, life histories, commercial fishes, bait fishes. Tables give native species with date of first recording, introduced species, and species found by survey. A chart shows details of distribution of both native and artificially planted fishes. The author discusses the causes of the remarkable differences between the native fish fauna of various parts of the watershed, probably due to: (1) diverse conditions of environment; (2) existing barriers; (3) prehistoric barriers and water connections (footnote, p. 56, refers to accounts of post-glacial history of the region); (4) influence of sea invasion (responsible for landlocking e.g., *Osmerus* and *Petromyzon*); (5) the greater uplift at the north, which brought about the close of the marine stage, acting as a dam to the lake and sending its waters back into river valleys. There is danger of destroying the natural balance in these waters by unwise artificial stocking and by over-destruction of the three "vermin fish" (the ling, gar, and bowfin) of the region. The author suggests advisable measures of fish protection, particularly by safeguarding natural reproduction by protection of spawning grounds, and by special stocking policy. Annotated list of 78 spp. in 33 fams. is given.—*F. LaMonte.*

17938. GREENE, C. WILLARD. The smelts of Lake Champlain, with supplementary material from the Finger Lakes, the Saranac chain, and the Cold Spring Harbor hatchery, Long Island, New York. *New York State Dept. Conserv. Suppl. to 19th Ann. Rept.* p. 105-129. 1 pl., 3 fig. 1929(1930).—This study of the smelts of Lake Champlain is directed toward ascertaining the biological relationships between the smelts and other members of the fauna of Lake Champlain. It considers the constituents of the smelt population which is comprised of 2 races, one small, growing to approximately 7½ inches, and one large, growing to approximately 14 in. There were no observations of the actual spawning of the smelts of the lake but some correlative observations are discussed. The distribution of adult, yearling, and young smelts is treated with reference to position in the lake as a whole, depths, and habits. The food of each race is analyzed with reference to indications of relationships between the races and to the other fauna of the lake. A list is given of the other fishes of Lake Champlain which use smelts as food. Comparative material of the smelts of Canandaigua and Owasco lakes of the Finger Lakes and of the smelt of the Saranac chain of lakes is discussed at appropriate places throughout the study. Certain recommendations with references to conservation and stocking policies are made upon the basis of the study.—*Author's summary.*

17939. HORNYOLD, A. GANDOLFI. Recherches sur le sexe et l'âge de la petite anguille jaune en Anjou. *Bull. Soc. Zool. France* 54: 214-245. Map. 1929.—The proportion of the sexes differs in different localities. Tables give localities, length, weight, sex, scale zones, otolith zones, distances from the sea (maximum 177 km.). Female yellow eels reach a length of 1 m. and weight of several kilograms; the ♂♂ rarely surpass 45 cm. and a weight of 150 gr.—*F. LaMonte.*

17940. HUNTER, W. A. The romance of fish life. 164p. 17 pl., 13 fig. Macmillan Co.: New York, 1931. Pr. $1.50.—This is a series of 4 popular lectures on types of sea fish, age determination by scales and ear-bones, life history of the eel; habits, migrations, spawning, and life history of the Atlantic salmon; the operations and catches of the steam trawlers, herring drifters, long liners, and the cockle, mussel, oyster, shrimp, and prawn fisheries. The final chapter deals with the animal life on the sea floor, the plankton, and methods of marine exploration.—*C. A. Kofoid.*

17941. MAST, H. Die Ursachen des Rückganges der Fischerei im untern Lech von Augsburg an. *Ber. Naturwiss. Ver. Schwaben u. Neuburg* 46: 11-23. 1929.—The

fresh-waters of the lower Lech River may be divided, from their source downward, into (1) The territory of the trout (*Trutta fario*); (2) that of the grayling (*Thymallus thymallus*); (3) of the barbel, all characterized by strong current and reasonably low summer temp. Then come the stretches of sluggish water with carp, tench, pickerel, pike-perch; and finally the estuary and the sea. In waters fed by alpine snows in summer, the first 3 divisions extend further down, so that in spite of the distance from its source the Lech drainage near Augsburg falls within the territory of the barbel, and in addition contains *Salmo hucho*, the grayling, and occasional trout as resident species. Of greater fishery importance, however, was *Chondrostoma nasus*, which annually ascended these streams from the Danube in swarms, en route to its spawning grounds. The various steps are followed by which the waters near Augsburg have been dammed, or confined artificially, or polluted, and it is pointed out how these changes were detrimental to their fish life. Nevertheless *Chondrostoma* continued to run up stream in numbers each spring, until shut off from its last possible spawning ground. Then it abruptly ceased to appear.—*J. T. Nichols.*

17942. **MYERS, GEORGE SPRAGUE. The killifish of San Ignacio and the stickleback of San Ramon, Lower California.** *Proc. California Acad. Sci.* 19(9): 95-104. 1 fig. 1930.—*Fundulus lima* Vaillant from San Ignacio, is compared with *F. parvipinnis parvipinnis* and *F. p. brevis* and found to be distinct. One difference is the extraordinary development of the scale ctenii in breeding ♂ lima. *Gasterosteus aculeatus* (L.) is recorded from the Santo Domingo River, Lr. California. Vertebrae counts indicate that the supposed difference between the Santa Ana River form (*G. santae-anae* Regan) and other California sticklebacks is without foundation.—*J. H. Wales.*

17943. **NORMAN, J. R. Notes on flatfishes (Heterosomata). III. Collections from China, Japan, and the Hawaiian Islands.** *Ann. and Mag. Nat. Hist.* 8(48): 597-604. 1931.—Bothidae: *Pseudorhombus* Bleeker (= *Spinirhombus* Oshima); *Spinirhombus taiwanus* Oshima, *Pseudorhombus misakius* Jordan & Starks, and *P. formosanus* Oshima are probably identical with *P. cinnamoneus* (Temminck & Schlegel), and *S. levisquamis* Oshima with *P. javanicus* (Bleeker); *Pseudorhombus malayanus* Bleeker is considered distinct from *P. oligodon* (Bleeker); *P. pentophthalmus* Günther (=*P. ocellifer* Regan); *Taeniopsetta radula* Gilbert is considered distinct from *T. ocellata* (Günther); *Anticitharus* Günther is no more than a subgenus of *Arnoglossus* Bleeker (=*Caulopsetta* Gill); *Psettina* Hubbs (=*Crossolepis* Norman); *P. iijimae* Jordan & Starks (=*Arnoglossus profundus* Weber); *Crossorhombus azureus* (Alcock) (=*Scaeops kobensis* Jordan & Starks, *Platophrys microstoma* Weber); **PARABOTHUS** (p. 600), near *Bothus*, type *P.* **polylepis** (*Arnoglossus p.* Alcock) (p. 601), including also *P.* **coarctatus** (Gilbert), n. comb. (p. 601), *P.* **chlorospilus** (Gilbert), n. comb. (p. 601), and *P.* (?) **violaceus** (Franz), n. comb. (p. 601); *Chascanopsetta lugubris* Alcock (=*Trachypterophrys raptator* Franz); *Laeops* Günther (=*Scianectes* [author?], *Lambdopsetta* [author?]). Pleuronectidae: *Poecilopsetta* Günther (=*Paralimanda* Breder); a key is given to the 7 spp. of *Samariscus*, including *S.* **glossa** (*Plagiopsetta g.* Franz) (p. 603). Critical notes are given on a number of other spp.

17944. **PÉRARD, CH. Le Congre caoutchouc. (Contribution à l'étude du métabolisme des graisses chez les poissons.)** *Bull. Biol. France et Belgique* 64(2): 205-210. 1930.—The flesh of *Conger vulgaris* Cuv. brought to the Paris markets for sale assumed the consistency of rubber during the months Jan. to March. This was due to an increase in the water content and a decrease in the fat. At the same time the fat content of the ovaries increased considerably. Since it is probable that this is the migratory season for this species, the fat was mobilized to the ovary to supply sustenance for the tremendous numbers of eggs soon to be laid; part of the fat was used for the energy demands of the individual. This indicates that the reproductive part of the life cycle closely resembles that of the salmon.—*W. Goldfarb.*

17945. **[PROKHOROVA, K. P.] ПРОХОРОВА, К. П. Возраст и темп роста сырка [(Coregonus peled (G)] озер низовья реки Оби. [Age and rate of growth of C. peled from the lakes of the lower Ob region.]** [English summary.] Труды Сибирской Научной Рыбохозяйственной Станции (*Rept. Siber. Sci. Sta. Fisheries* [*Krasnoyarsk*]) 5(1): 59-77. 1 fig. 1930.—Study was made of 230 *C. peled* from Lake Syrkovoe. During the spring flood of 1922, when this lake communicated with the Ob, all but the young generation left the lake. Thus fishes caught in 1928 were mainly 6+ yrs. old, with some of their offspring dating from 1925-26. As no communication with the river has existed since 1922, the presence of the younger age group in the lake shows that the sp. spawns there. No appreciable difference existed between length and weight of ♂♂ and ♀♀. As compared with *C. peled* from the rivers the growth was retarded; in *C. peled* from "taiga" and tundra lakes no such retardation was found.

17946. **RABINERSON, A. Beiträge zur Kenntnis der russischen Formen von Clupea harengus L.** *Zool. Jahrb. Abt. Syst. Ökol. u. Geogr. Tiere* 58(3): 287-338. 1929.—All races of herring known from Russian waters are reviewed. Three subspp. are recognized, namely, *Clupea harengus harengus*, from the Murman coast, *C. h. membras* from the Gulf of Finland, and *C. h. pallasi* from the Pacific Ocean (including the N. Amer. coast), Cheskayæ Bay, the Arctic Ocean, and the White Sea. No new races of *C. h. harengus* were found on the Murman coast. To determine the races there, the fish would have to be studied in connection with specimens from Norway. Two races of *C. h. membras*, a big eyed and a small eyed one, were noted in the Baltic Sea, but their real significance is not clear. *C. h. pallasi*, the fish inhabiting the Gulf of Peter the Great, constitutes a distinct race, and the author regards it as highly probable that in the Far East a northern and a southern race exist. The herring in the White Sea are divisible into 2 races: Large sea herring and fjord herring. No determination was reached relative to the races in the Bay of Cheskayæ. Proportional measurement was virtually useless in identifying subspp. and races, and the classification is based largely on vertebra counts and duration of the growth period, the latter being determined from scale studies.—*S. F. Hildebrand.*

17947. **RACHMANOWA, S. Über Pleuronectes platessa des Barentsmeeres. II.** *Zool. Anz.* 85(5/8): 139-149. 1929.—The specimens on which the study is based were collected in 1927 and 1928 in the Barents Sea in the vicinity of the Murman Coast and in the different gulfs of the Murman Coast. Large plaice were taken principally in the open sea, and they became scarcer as the shore was approached. Small plaice were common on the shores and in the bays. The number of vertebrae and fin rays (dorsal and anal) shows that the plaice of the western part of Barents Sea constitute a distinct race. The O-class shows a large variation in size, due probably to a long spawning season and possibly to other factors not understood. In the II and III year classes, a difference in size is apparent according to place of capture, the fish having grown faster in some localities than others. After assuming the asymmetrical form when the fish come to occupy the bottom, the plaice of the O, I, II, and III year classes (sufficient material for the older classes is lacking) stay in the same place, or at most move about within one gulf or bay. The older plates probably migrate toward the open sea. In the II year class ♂♂ and ♀♀ are of equal size, in the III, IV, and V classes the ♂♂ are larger, but later the ♀♀ overtake the ♂♂ and the indications are that ♂♂ never reach as high an age as some ♀♀ (12 to 18 yrs.). The specimens taken in 1928 are smaller than those taken in the same localities in 1927. Slower growth appears to have taken place in 1928 on account of a pre-

vailing lower temp. of the water. Sexual maturity is reached in 4 yrs. in some individuals in 5 and 6 yrs. in others. Males carry ripe sexual products longer than ♀♀. The principal spawning season extends from April to May, but in some localities it is later than in others, ripe fish having been taken as late as Sept. 1.—*S. F. Hildebrand.*

17948. **RANZI, SILVIO. Stadi giovanili di Sparidi del Golfo di Napoli.** [Juvenile stages of Sparidae of the Gulf of Naples.] *Pubbl. Staz. Zool. Napoli* 10(3): 407-416. 1930.—Distinguishing characters are given for the young of 15 spp., at lengths varying from 5 to 31 mm.

17949. **RUSSELL, F. S. The seasonal abundance and distribution of the pelagic young of teleostean fishes caught in the ring-trawl in offshore waters in the Plymouth area.** *Jour. Marine Biol. Assoc.* 16(3): 707-722. 1930.—The seasonal abundance of the post-larval stages of teleostean fishes in the waters of the English Channel of Plymouth is given, based on collections made by 2 metre stramin ring-trawl over a period of 6 years. The average monthly abundance is given for the following spp.: *Clupea harengus, C. sprattus, Sardina pilchardus, Gadus pollachius, G. merlangus, G. minutus, G. luscus, G. callarias, Onos* sp., *Molva molva, Merluccius merluccius, Raniceps raninus, Capros aper, Zeus faber, Arnoglossus* sp., *Rhombus* sp., *Scophthalmus norvegicus, S. unimaculatus, Zeugopterus punctatus, Pleuronectes limanda, P. flesus, P. microcephalus, Solea vulgaris, S. variegata, S. lutea, Serranus cabrilla, Caranx trachurus, Mullus surmuletus, Ammodytes tobianus, A. lanceolatus, Cepola rubescens, Callionymus* sp., *Labrus bergylta, L. mixtus, Ctenolabrus rupestris, Crenilabrus melops, Centrolabrus exoletus, Trachinus vipera, T. draco, Scomber scomber, Gobius* sp., *Lebetus scorpioides, Blennius ocellaris, B. pholis, B. gattorugine, Chirolophis galerita, Agonus cataphractus, Trigla* sp., *Cottus bubalis, Liparis montagui, Lepadogaster bimaculatus, Lophius piscatorius,* and *Belone vulgaris.* A full bibliography of the literature on post-larval fishes in the Plymouth area is given.—*F. S. Russell.*

17950. **SCHECHTEL, EDWARD. Pokarm powietrzny u pstraga (Trutta fario L.). [Aerial feeding in trout (T. fario).]** [With German summary.] *Roczniki Nauk i Leśnych (Polish Agric. & Forest. Ann.)* 18(1): 85-99. 1 fig. 1927.—Trout get much more of their food from the air than has been commonly supposed.

17951. **SMEDLEY, N. Notes on elasmobranch eggs.** *Bull. Raffles Mus.* 5. [63]-[66]. 3 fig. 1931.—Up to 50 mm., the embryo* of *Chiloscyllium indicum* lies along the upper margin of the egg-case*, with head pointing to anterior end. At 90 mm. the body is curled, and the ventral surface is apposed to the left wall of the case. At 95 mm. the head points to the posterior end, but just before hatching the head is again anterior.

17952. **SPENCE, REGINALD, and S. H. PRATER. The fish supply of the west coast of India, part II.** [Continuation.] *Jour. Bombay Nat. Hist. Soc.* 35(1): 77-88. 5 pl. 1931.—Discusses estuary and inshore fishing and fishing grounds, giving common and scientific names, and brief notes on the habits, value, etc., of numerous species of the region, 19 of which are figured on the plates.—*Evermann and Clark.*

17953. **[SVIDERSKAĬA, A. K.] СВИДЕРСКАЯ, А. К. Возраст и темп роста окуня [Perca fluviatilis (L.)] озера Убинского. [Age and rate of growth of P. fluviatilis from Lake Ubinsk (Western Siberia).]** [English summary.] Труды Сибирской Научной Рыбохозяйственной Станции (*Rept. Siber. Sci. Sta. Fisheries [Krasnoyarsk]*) 5(1): 153-186. 1 fig. 1930.—Study was made of 410 specimens. The rate of growth is greater in the ♀♀; in both sexes it is most rapid in the 2nd year. Among those 2-3 yrs. old were found individuals of a considerably larger race. The smaller race lives in shallower places. Both races are mixed in early life, but separate on attaining sexual maturity. The growth of the smaller race is retarded, and that of the larger race accelerated, as compared with the growth of perch in other waters.

17954. **TANAKA, SHIGEHO. On the distribution of fishes in Japanese waters.** *Jour. Fac. Sci. Imp. Univ. Tokyo, Sect. 4: Zool.* 3(1): 1-90. 3 pl. (2 col.). 1931.—This paper is restricted to the fish fauna of Hokkaido, Hondo, Shikoku, and Kiushiu. The author first discusses a number of examples of variation according to individual, age, sex, season, and locality. Colored plates show 3 color varieties of *Branchiostegus japonicus* and the sexual variation of *Xanthichthys lineopunctatus.* Local variations of *Pterogobius elapoides* are also illustrated. A northern and a southern marine faunal area are delimited; they meet on the Pacific side (where they are strongly differentiated) at Inuba Cape near Chosi, and on the Japan Sea side (where they are weakly differentiated) in the vicinity of Hamada. Not a few fresh-water fishes enter estuarine water, and thus attain a wide distribution. Three fresh-water faunal areas are distinguished: southern Japan, northern Hondo, and Hokkaido. The boundary between the last two is Blakiston's Line. None of the fresh-water spp. are peculiar to Japan. Special comment is made on the fish fauna of the following peculiar areas: Ariake and Yatsushiro Sounds, Inland Sea, Toyama Bay, and Lake Biwa. Extensive lists are given of the fishes of each of the larger faunal areas, and there are also separate lists of the spp. that are common to 2 or more of these areas. Many synonyms are mentioned in these lists. There is an extensive bibliography.

17955. **TREMBLEY, F. J. The gar-pike of Lake Champlain.** *New York State Dept. Conserv. Suppl. to 19th Ann. Rept.* p. 139-145. 3 fig. 1929(1930).—One summer's observation indicated that the gar-pike in Lake Champlain feeds entirely on fish. The species eaten were those common in the weed bed habitat of the gar, viz., perch, sunfish, golden shiners and other minnows. It is suggested that in the absence of gar-pike such species as perch and sunfish might increase to the detriment of game species. Carp were rare when gar occurred. Further work is necessary before a decision can be reached as to the influence of gar-pike on the lake fisheries.—*J. R. Dymond.*

AMPHIBIA AND REPTILIA

G. K. NOBLE, *Editor,* Amphibia

KARL PATTERSON SCHMIDT, *Editor,* Reptilia

(See also in this issue Entries 15262, 15901, 16142, 16592, 17271, 17307, 17311, 17324, 17331, 17337, 17355, 17390, 17396, 17397, 17398, 17406, 18068, 18114, 18117)

GENERAL

17956. **CRAWFORD, STANTON C. Field keys to the lizards and amphibians of British Guiana.** *Ann. Carnegie Museum* 21(1): 11-42. 1931.—The diagnosis of 52 lizard species of the families Gekkonidae, Iguanidae, Teiidae, Amphisbaenidae and Scincidae, and 61 amphibian species of the families Pipidae, Bufonidae, Hylidae, Brachycephalidae, Ranidae, Brevicipitidae, and Coeciliidae believed to occur in the colony. The presence in the colony of *Hyla marmorata* and *Ceratophrys cornuta* is confirmed.—*S. C. Crawford.*

17957. **HARPER, FRANCIS. Notes on fishes, amphibians, and reptiles of Randolph County, Georgia.** *Copeia* 1930(4): 152-154. 1930.—Annotated list of 2 fishes, 10 amphibians, and 8 reptiles.

17958. **MERTENS, ROBERT. Die Amphibien und**

Reptilien der Inseln Bali, Lombok, Sumbawa und Flores. (Beiträge zur Fauna der Kleinen Sunda-Inseln, 1.) *Abhandl. Senckenbergischen Naturforsch. Ges.* 42(3): 117-344. Maps, 10 pl. 1930.—Following a short description of the journey, a list of the fauna and a historical survey of herpetological work in the region of these islands are given. A more detailed discussion is given of the geographical distribution of the Lester-Sunda Amphibia and Reptilia, which belong chiefly to the Indo-Oriental forms but are connected with Papuo-Australian; there is also an endemic element. The herpetological fauna of Bali is not identical with that of Java; Bali from the herpetological standpoint should be placed among the Indo-Australian transition fauna. Also the ecological relations of Amphibia and Reptilia are described: steppe and forest forms, vertical distribution, passive dispersal. The section on evolution takes up the effect of isolation, discontinuous species formation, convergent mutations, etc. Ninety forms are described mostly from material collected by the author, with especial attention to the distinguishing characters, variability, distribution, and habits. *Draco volans* reticulatus (*D. reticulatus* Günther) (p. 249); a length of 3004 mm. is recorded for the largest hitherto known example of *Varanus komodensis*; Sphenomorphus f. florensis* (Weber) (=*S. f. nitidus* Dunn); Java is designated as the type locality of *Python molurus* bivittatus* (*P. bivittatus* Schlegel) (p. 287). Extensive bibliography.—*R. Mertens (transl. by A. M. Boring).*

17959. **PARKER, H. W. Some reptiles and amphibians from S. E. Arabia.** *Ann. and Mag. Nat. Hist.* 8(47): 514-522. 1931.—This is a report on collections made by Bertram Thomas in his crossing of the Rub'al Khali Desert in 1930-31. Two very distinct faunas are represented: that of the forested mountains and valleys inland from Dhufar (Qara Mt. region), and that of the arid, steppe-fringed Rub'al Khali. The first fauna resembles that of the savannah provinces of N. E. Africa, whereas the reptiles of the barren desert are extremely specialized and of decidedly Palaearctic affinities. Not a single reptilian sp. is common to the 2 faunas. From the Qara Mts. and the Dhufar littoral 5 lizards, 8 snakes, and 1 toad are recorded, including: *Pristurus carteri* tuberculatus (p. 515), *Coluber* thomasi (p. 516), and *Bufo* dhufarensis (p. 518); types in Brit. Mus. From the desert 12 lizards and 3 snakes are recorded.

AMPHIBIA

17960. **ANGEL, F. Matériaux de la mission G. Petit à Madagascar: Description de trois batraciens nouveaux appartenant aux genres Mantidactylus et Gephyromantis.** *Bull. Mus. Nation. Hist. Nat.* [*Paris*] 1(6): 358-362. 1929. —*Mantidactylus* mocquardi (p. 359); *M.* laevis (p. 360); *Gephyromantis* methueni (p. 361). All from Madagascar; types in Paris Mus.

17961. **NAUMOV, GEORG P. Zur Frage der Färbung einiger Salientia während der Brunstzeit.** *Zool. Anz.* 87(1/2): 39-42. 1930.—Seasonal changes and sex difference in the pigmentation of *Bufo viridis, Rana temporaria,* and *R. arvalis.—A. Walton.*

17962. **POPE, CLIFFORD H. Notes on amphibians from Fukien, Hainan, and other parts of China.** *Bull. Amer. Mus. Nat. Hist.* 61(8): 397-610. Map, 39 fig. 1931. —This is a complete list of the Chinese amphibians in the collection of the Amer. Mus. of Nat. Hist. including extensive notes on life histories and habitat preferences based on field observations made by the author. Various adaptations to life in torrential streams are described and discussed. Full summaries of the former contributions to the herpetology of Fukien Province and the Island of Hainan are given. Keys for the identification of anuran larvae are included. Certain species are synonymized as follows: *Tylototriton verrucosus* Anderson (=*T. asperrimus* Unterstein); *Pachytriton brevipes* (Sauvage) (=*Molge labiatum* Unterst.); *Ooeidozyga lima* (Gravenhorst) (=*Osteosternum amoyense* Wu); *Rana spinosa* David (=*R. courtoisi* Angel, *R. dubois-reymondi* Vogt); *R. adenopleura* Boulenger (=*R. caldwelli* Schmidt); *R. andersonii* Boulenger (=*R. melli* Vogt); *Polypedates dennysi* (Blanford) (=*P. feyi* Chen). The following larval forms are described for the first time: *Hynobius chinensis*; Hyla chinensis*; H. sanchiangensis*; H. simplex*; Rana adenopleura*; R. asiatica*; R. guentheri*; R. latouchii*; R. montivaga*; R. nigromaculata mongolia*; R. n. reinhardtii*; R. plancyi*; R.* (sp. ?)*; *Polypedates dennysi*; P. oxycephalus*; P.* (sp. ?)*; *Philautus doriae*; Kaloula borealis**. Three larvae, though reported for the first time, are not described because of their similarity to known forms: *Megophrys kuatunensis; Bufo bankorensis; Polypedates leucomystax megacephalus.—C. H. Pope.*

17963. **STEJNEGER, LEONHARD. Two new tailless amphibians from western China.** *Proc. Biol. Soc. Washington* 39: 53-54. 1926.—*Megophrys* minor (p. 53) and *Rana* jugans (p. 53), both from Szechwan; types in U. S. Nat. Mus.

17964. **TOIT, C. A. du, and D. A. SCHOONEES. The bearing of cranial morphology upon Noble's dictum that Heleophryne is merely a toothed bufonid.** *S. African Jour. Sci.* 27: 439-441. 1930.—The results of an exhaustive investigation of the skulls of *Bufo* and *Heleophryne* were compared with view to verifying Noble's dictum. The conclusions are that with respect to the cranial morphology there is no convincing evidence in support of Noble's pronouncement. From present available data, the authors are not yet prepared to refer *Heleophryne* to any particular family of the Anura.—*J. van de Erve.*

17965. **WALKER, CHARLES F. Description of a new salamander from North Carolina.** *Proc. Junior Soc. Nat. Sci.* [*Cincinnati*] *Memorial Number.* 4 unnumbered pp. 1931.—*Plethodon* welleri, type in U. S. Nat. Mus.

17966. **WELLER, W. H. Notes on Aneides aeneus Cope and Packard.** *Proc. Junior Soc. Nat. Sci.* [*Cincinnati*] 1(1): [2-3]. 1930.—First record from Great Smoky Mts., Tennessee.

17967. **WELLER, W. H. Notes on amphibians collected in Carter Co., Ky., by the Junior Society of Natural Sciences.** *Proc. Junior Soc. Nat. Sci.* [*Cincinnati*] 1 (5/6): [6-9]. 1930.—Observations on 10 spp., including *Pseudotriton* duryi (p.[9]), Kentucky.

17968. **WELLER, W. H. Corrections to herpetological notices.** *Proc. Junior Soc. Nat. Sci.* [*Cincinnati*] 2(1): 7-9. 1931.—*Gyrinophilus* duryi (*Pseudotriton d.* Weller) (p. 8); *Desmognathus fuscus imitator* Dunn (=*D. aureatagulus* Weller).

17969. **WELLER, W. H. A preliminary list of the salamanders of the Great Smoky Mts. of North Carolina and Tennessee.** *Proc. Junior Soc. Nat. Sci.* [*Cincinnati*] 2(1): 21-32. 1931.—Annotated list of 12 spp., with descriptive and taxonomic notes and habitat records.

REPTILIA

17970. **BARBOUR, THOMAS. A new North American lizard.** *Copeia* 1931(3): 87-89. 1931.—*Anolis* stejnegeri (p. 88), Florida, type in Mus. Comp. Zool.

17971. **BURT, CHARLES E. On the occurrence of a throat-fan in the sand lizard, Uma notata Baird, with notes on the adaptive specializations of the form.** *Copeia* 1931(1): 15-16. 1 fig. 1931.—Apparently first record of a throat-fan in the genus *Uma.* Adaptive specialization for life in sandy deserts is shown in body form and coloration.

17972. **COCHRAN, DORIS M. A new lizard from Haiti (Sphaerodactylus stejnegeri).** *Copeia* 1931(3): 89-91. 1931.—*S.* stejnegeri p. (90), Haiti (type, in U. S. Nat. Mus.) and Santo Domingo.

17973. **COCHRAN, DORIS M. New Bahaman reptiles.** *Jour. Washington Acad. Sci.* 21(3): 39-41. 1931.—*Leiocephalus* inaguae (p. 40); *L. carinatus* punctatus (p. 40); *Cyclura carinata* bartschi (p. 40); *Anolis leucophaeus* mariguanae (p. 40). Types in U. S. Nat. Mus.

17974. **HAUGHTON, S. H., and L. D. BOONSTRA. Pareiasaurian studies. Part 1. An attempt at a classification of the Pareiasauria based on skull features.** *Ann. South African Mus.* 28(1): 79-87. 1929.—[For parts 3 and 4, see B. A. 4(10): entries 26206 and 26207.] Clas-

sification based on shape of skull top, shape of snout, nature of cheek, shape of jaw, teeth. Division A, teeth with few cusps irregularly arranged. Subdivision Aa, interorbital width less than tabular. *Bradysaurus* Watson, broad rounded snout, shallow cheek, 6 cusps on tooth, *B. baini* (Seeley), *B.* **seeleyi** (p. 82), *B.* **vawderbyli** (p. 82); these and following types are from S. Africa, *Tapinocephalus* Zone (Middle Permian), unless otherwise noted, and in S. African Mus. **BRADYSUCHUS** (p. 82), snout pointed, cheek deep, cusps unknown, *B.* **whaitsi** (*Pareiasaurus w.* Broom) (p. 82). Subdivision Ab, interorbital width= tabular. **NOCHELESAURUS** (p. 83), snout rather pointed, cheek deep, teeth massive, 6-8 cusps, *N.* **strubeni** (*Pareiasaurus s.* Broom) (p. 83), *N.* **alexanderi** (p. 83). **DOLICHOPAREIA** (p. 83), snout very pointed, cheek deep, *D.* **angusta** (p. 83). Subdivision Ac, interorbital width greater than tabular. **KOALEMASAURUS** (p. 84), orbit in front half of skull, *K.* **acutirostris** (*Pareiasaurus a.* Broom) (p. 84). **BRACHYPAREIA** (p. 84), orbit not in anterior half, cheek broad, low, *B.* **rogersi** (*Pareiasaurus r.* Broom) (p. 84), *B.* **watsoni** (p. 84). **PLATYOROPHA** (p. 84), orbit not in anterior half, cheek narrow, deep, *P.* **broomi** (p. 85). Division B, teeth with 9 cusps irregularly arranged, interorbital width= tabular, *Embrithosaurus* Watson, with *E. schwarzi* Watson. Division C, 9 or more cusps arranged regularly. Subdivision Ca, top of skull narrow, *Anthodon* Owen with *A. serrarius* Owen. Subdivision Cb, top broad, *Pareiasaurus* Owen, skull pointed, cheeks very deep, ilium strongly inclined forward, ischium short, *P. serridens* Owen; *P. russowi* Seeley probably a synonym. *Pareiasuchus* Broom & Haughton, snout rounded, cheek deep and rugose, ilium as above, ischium long, *P. peringueyi* B. & H., *P.* **nasicornis** (p. 86), type from Graaff Reinet (Up. Permian). Subdivision Cc, skull unknown, genus *Propappus* Seeley, ilium not much inclined forward, ischium short. *P. omocratus* Seeley, *P. parvus* Haughton.—*A. S. Romer.*

17975. KLAUBER, LAURENCE M. A new subspecies of the California boa, with notes on the genus Lichanura. *Trans. San Diego Soc. Nat. Hist.* 6(20): 305-318. Map, 1 pl. 1931.—*Lichanura roseofusca* **gracia*** (p. 307), California (type) and Arizona. A detailed comparison is made with *L. r. roseofusca** and *L. trivirgata*. There are notes on synonymy, color, habits, habitat, and distribution, and a key.

17976. KLAUBER, LAURENCE M. A new species of Xantusia from Arizona, with a synopsis of the genus. *Trans. San Diego Soc. Nat. Hist.* 7(1): 1-14. Map, 1 pl. 1931.—*X.* **arizonae*** (p. 3), type in author's coll., the genus being new to Arizona. A synopsis and a key are given for the 5 spp. of this genus, with locality records and notes on habits.

17977. LOVERIDGE, ARTHUR. A new snake of the genus Typhlops from the Belgian Congo. *Copeia* 1931 (3): 92-93. 2 fig. 1931.—*T.* **stejnegeri*** (p. 92), type in U. S. Nat. Mus.

17978. PATTERSON, BRYAN. Occurrence of the alligatoroid genus Allognathosuchus in the Lower Oligocene. *Field Mus. Nat. Hist. Publ.* (297), *Geol. Ser.* 4(6): 223-226. 1 pl. 1931.—*Allognathosuchus* **riggsi** (p. 223), based on mandible* from *Titanotherium* beds, S. Dakota; type in Feld Mus. *Allognathosuchus* is regarded as nearer to *Alligator* than to *Caimanoidea*, the last 2 genera not being especially close.

17979. PENDLEBURY, H. M. A "flying" snake. *Bull. Raffles Mus.* 5. [75]. 1931.—In the Federated Malay States a snake of undetermined sp. was seen to move through the air from near the top of a tall tree at an angle of about 45° to the ground, traveling a distance of about 100 ft. in roughly 7 seconds. The tail was lashed vigorously during the descent, and the snake alighted under complete control.

17980. ROSS, ROLAND CASE. Behavior of the rubber snake. *Copeia* 1931 (1): 7-8 1931.—In Calaveras County, California, *Charina b. bottae* is usually active in summer from about 5 to 8 P.M., and during the morning up to 8 A.M. It retires into the ground in the evening at 52°-50° F. It readily climbs trees with rough bark. In captivity it feeds on young mice.

17981. TAYLOR, EDWARD H. Notes on two specimens of the rare snake Ficimia cana and the description of a new species of Ficimia from Texas. *Copeia* 1931 (1): 4-7. 1931.—Redescription of *F. cana* (Cope), with notes on habits in New Mexico. *F.* **streckeri** (p. 5), Texas, type in Kansas Univ. Mus.

(See also in this issue section Economic Ornithology; and Entries 15136, 15913, 16884, 17295, 17329, 18068, 18110, 18112, 18113, 18114, 18117)

GENERAL AND POPULAR

17982. AIKEN, C. E. H. An ancient bird skin. *Auk* 47(1): 101. 1930.—Perfectly preserved skin of a mountain bluebird found among cliff-dweller relics in Utah.

17983. ASHBROOK, FRANK G. The blue book of birds of America: A bird guide containing the following orders of birds: Goatsuckers, swifts, etc., perching birds —including the tyrant flycatchers, larks, crows and jays, starlings, Icteridae, and finches. 96p. Col. illus. Whitman Publ. Co.: Racine, Wisconsin, 1931.

17984. ASHBROOK, FRANK G. The green book of birds of America: A bird guide containing the orders of perching birds including tanagers, swallows, waxwings, shrikes, vireos, warblers, pipits, dippers, mimic thrushes, wrens, nuthatches and creepers, titmice, wren tits, kinglets, gnatcatchers, and thrushes. 95p. Col. illus. Whitman Publ. Co.: Racine, Wisconsin, 1931.

17985. ASHBROOK, FRANK G. The red book of birds of America: A bird guide containing diving birds, swimmers, herons, storks, ibises, marsh dwellers, shore birds, pigeons and doves, birds of prey, cuckoos and woodpeckers. 96p. Col. illus. Whitman Publ. Co.: Racine, Wisconsin, 1931.

17986. BIERENS de HAAN, J. A. Der psychologische Wert der Sprache bei den Vögeln. [The psychological value of language in birds.] *Proc. Internat. Ornithol. Congr.* 7: 186-196. 1930 (1931).

17987. DICE, LEE R. Methods of indicating relative abundance of birds. *Auk* 47(1): 22-24. 1930.—The author suggests a method of keeping lists by half-hours in the field and by habitats, so that the percentage abundance of the various species can be computed.

17988. HOWELL, ARTHUR H. Florida bird life. 579p. 72 maps, 58 pl. (37 col.) Florida Department of Game and Fresh Water Fish: Tallahassee, 1932. Pr. $6.00.—This is a thorough and comprehensive work on the birds of Florida. While based largely upon the author's field work during the past 14 yrs. in behalf of the U. S. Biol. Survey, it takes into account the work of the numerous other ornithologists who have visited the state. Their field activities and their publications are reviewed in some detail in an introductory chapter on the history of Florida ornithology. A list is added of 82 birds originally described from the state. A chapter on the history of bird protection in Florida is contributed by ROBERT W. WILLIAMS. Ten physiographic regions of the state (flatwoods, high pineland, hammocks, sand scrub, swamp, Everglades, salt marshes, sea beaches, prairies, and the keys) are briefly described, with remarks on bird species characteristic of each. Two life

zones (Lower Austral and Tropical) are recognized and mapped. The former, occupying most of the state, is divided into a Floridian fauna, which includes most of the peninsula, and a Louisianian fauna, which includes the northwestern and northern parts of the state, from Gainesville and Jacksonville northward. The Tropical Zone is limited to the keys and a coastal strip extending north to Jupiter. Characteristic birds, mammals, trees, and shrubs of each life zone and fauna are listed. The greater part of the book (pp. 73-472) is devoted to accounts of the 362 species and 61 additional subspecies of birds that have been authentically recorded from the state; 12 additional species, recorded on insufficient evidence, are briefly discussed in a hypothetical list. Each account includes the technical and common names, recognition marks, general range, distribution in Florida, haunts and habits, and food. A vast amount of authoritative information on Florida birds is thus assembled, the previous literature being freely drawn upon. Maps show the distribution of many of the species and subspecies within the state. Of 58 plates, 37 in color by Francis L. Jacques portray about 174 species and subspecies with naturalistic backgrounds; most of the remainder are photographic illustrations of nests and haunts. An exhaustive bibliography of about 1400 titles and an index are added.

17989. **HUBER, WHARTON.** A method of salting and preparing water bird skins. *Auk* 47(3): 409-411. 1 pl. 1930.

17990. **LAMBRECHT, K.** Fortschritte der Palaeoornithologie. *Proc. Internat. Ornithol. Congr.* 7: 73-99. 1930 (1931).—Review.

17991. **LONGSTREET, R. J.** Notes on speed of flight of certain water birds. *Auk* 47(3): 428-429. 1930.—Data on 12 species, with speeds varying from 18 to 41 miles per hour.

SYSTEMATIC

17992. **AIKEN, C. E. H.** A bobwhite × California quail hybrid. *Auk* 47(1): 80-81. 1930.

17993. **BALDWIN, S. PRENTISS, HARRY C. OBERHOLSER, and LEONARD G. WORLEY.** Measurements of birds. *Sci. Publ. Cleveland Mus. Nat. Hist.* 2: i-ix+1-165. 151 fig. 1931.—To supply the lack of a comprehensive manual on the subject, the authors have worked out as accurately as possible a satisfactory system of external measurements for living birds, birds in the flesh, and museum specimens. They describe about 176 measurements with the aim of leading to some recognized standard and consequent uniformity. Where 2 or more methods have been commonly used for the same measurement, the preferred method is indicated. An illustrative figure accompanies the description of nearly every measurement. An appended bibliography of 90 titles includes such publications as contain some separate explanation of the methods of taking measurements of birds; and a digest of the measurements treated in each of these publications is added. Index.

17994. **BANGS, OUTRAM.** The screech owls of eastern North America. *Auk* 47(3): 403-404. 1930.—The author gives a synopsis of the characters and distribution of the 3 subspecies which he recognizes: *Otus asio naevius* (Gm.), *O. a. asio* (L.), and *O. a. floridanus* (Ridgway). The last is resurrected from the synonymy of the second.

17995. **BOWEN, W. WEDGWOOD.** Geographical variation in Trachyphonus margaritatus. *Proc. Acad. Nat. Sci. Philadelphia* 84: 9-10. 1932.—Four subspecies are briefly reviewed, including *T. m.* **berberensis** (p. 10), Anglo-Egyptian Sudan; type in Acad. Nat. Sci. Philadelphia.

17996. **CARRIKER, M. A. Jr.** Additional new birds from Peru with a synopsis of the races of Hylophylax naevia. *Proc. Acad. Nat. Sci. Philadelphia* 84: 1-7. 1932.—*Upucerthia* **aricomae** (p. 1); *U. excelsior* and *U. aricomae* are considered more closely allied to *Cinclodes* than to *Upucerthia; Phleocryptes melanops* **juninensis** (p. 2). The author presents a systematic review of 7 races of *Hylophylax naevia; H. n. consobrina* Todd is removed from the synonymy of *H. n. naevia* (Gm.); *H. n.* **peruviana** (p. 4); *H. n.* **inexpectata** (p. 6); *H. n. theresae* (Des Murs) (=*H. n. intermedia* Carriker). Types of new forms in Acad. Nat. Sci. Philadelphia.

17997. **CHAPMAN, FRANK M.** A new race of Phibalura flavirostris from Bolivia. *Auk* 47(1): 87-88. 1930.—*P. f.* **boliviana** (p. 88), type in Am. Mus. Nat. Hist.

17998. **FRIEDMANN, HERBERT.** A barbet new to science from Kenya Colony. *Auk* 47(1): 85-86. 1930.—*Pogoniulus bilineatus* **alius** (p. 86), type in *U. S. Nat. Mus.*

17999. **FRIEDMANN, HERBERT.** A lark new to science from north-central Kenya Colony. *Auk* 47(3): 418-419. 1930.—*Mirafra* **candida** (p. 418), type in U. S. Nat. Mus.

18000. **GRISCOM, LUDLOW.** New name for Caprimulgus ridgwayi minor. *Auk* 47(1): 85. 1930.—*Caprimulgus ridgwayi* **troglodytes** (*C. r. minor* Griscom, preocc.).

18001. **HOWELL, ARTHUR H.** Description of a new subspecies of the prairie warbler, with remarks on two other unrecognized Florida races. *Auk* 47(1): 41-43. 1930.—*Dendroica discolor* **paludicola** (p. 41), Florida, type in U. S. Nat. Mus.; *Dendroica pinus florida* (Maynard) and *Sitta pusilla caniceps* Bangs are recognized as distinct subspecies.

18002. **KRABBE, TH. N.** To formodede bastarder mellem de to grönlandske ederfuglearter. [Two supposed hybrids between the two Greenland species of eider.] *Vidensk. Meddel. Dansk Naturhist. For. Köbenhavn* 80: 543-555. 3 pl. (1 col.). 1926(1925).—The author describes 2 specimens*, apparently ♂♂, showing characters intermediate between those of *Somateria mollissima borealis* and *S. spectabilis*. They are illustrated by a colored plate. The author discusses the possibility of their being ♀♀ that have assumed the plumage of the ♂ as a consequence of possessing abnormal genitalia. He concludes that they are probably ♂ hybrids between the 2 species mentioned.

18003. **MAY, JOHN B.** Simultaneous loss of primaries in prenuptial molt of loon. *Auk* 47(3): 412-414. 1930.—*Gavia immer* and *G. lumme* [Gaviidae] lose all the primaries simultaneously in the prenuptial molt.

18004. **PETERS, JAMES L.** The identity of the toucans described by Linnaeus in the 10th and 12th editions of the Systema Naturae. *Auk* 47(3): 405-408. 1930.—The status of 4 names in the 10th ed. and of 7 names in the 12th ed. is discussed. *Ramphastos piperivorus* L., *R. picatus* L., and *R. piscivorus* L. are unrecognizable; *R. tucanus* L. (=*R. monilis* P. L. S. Mull.).

18005. **SCHÖNWETTER, M.** Fossile Vogeleischalen. *Novitates Zool.* [*Tring*] 35(2): 192-203. 1929.—A number of shells and fragments, mainly specimens at Tring, are described, including: *Struthio camelus,* from a Nubian grave; *S. chersonensis,* 2 eggs from China resembling the type from the Black Sea; *S. indicus*?, Indian fragments pertaining to an extinct species, not *S. molybdophanes; S. camelus,* fragments from El-Meksa, Sahara; *Psammornis rothschildi,* Saharan fragments; *Aepyornis,* 5 complete shells from Madagascar, in which 4 species are to be distinguished; *Dinornis,* of 3 species, the shell similar to that of *Rhea,* not *Apteryx.* Mongolian fragments in the Brit. Mus. are comparable to eggs of *Struthio camelus spatzi* of W. Africa. The Mongolian "dinosaur" eggs probably do not pertain to that group; the eggs are too large for the small supposed parents; their superficial granulation is not found in recent reptiles. A table of measurements is given for fossil eggs of *Aepyornis, Psammornis, Struthio,* and *Dinornis;* those of living ratites, certain crocodilians, and the Gobi "dinosaur" eggs are included for comparison.—*A. S. Romer.*

18006. **SNYDER, L. L.** Sexual differentiation in the plumage of the black-bellied plover. *Auk* 47(1): 79-80. 1930.—*Squatarola squatarola* seems to be in a primary stage of sex differentiation.

18007. STRESEMANN, ERWIN. Welche Paradiesvogelarten der Literatur sind hybriden Ursprungs? *Novitates Zool.* [*Tring*] 36(1): 6-15. 1930.—The suspicion that certain rare birds of paradise are hybrids has been confirmed by recent explorations in New Guinea, for these rarities have not turned up again among the other specimens collected. The author concludes, from an examination of material in the Tring, British, Leiden, and other museums, that 18 species and 8 genera of the literature are of hybrid origin, and must be removed from the lists of existing species. The hybrid nature of some of these birds had been suggested by previous authors. Differences in the offspring of certain parent species are accounted for by reciprocal crossing. *Rhipidornis gulielmi-tertii* (A. B. Meyer), *Cicinnurus lyogyrus* Currie, and *C. goodfellowi* Og. Grant = *Diphyllodes magnificus* (Penn.) × *Cicinnurus regius* (L.); *Neoparadisea ruysi* van Oort = *Paradisaea m. minor* Shaw × *Diphyllodes m. magnificus* (Penn.); *Paradisaea maria* Rchw. = *P. apoda augustae-victoriae* Cab. × *P. guilelmi* Cab.; *P. duivenbodei* Menegaux = *P. minor finschi* A. B. Meyer (?) × *P. guilelmi* Cab.; *Janthothorax mirabilis* (Rchw.) = *Paradisaea minor* Shaw × *Seleucides nigricans* (Shaw); *J. bensbachi* Büttikofer = *Paradisaea minor* Shaw × *Ptilorhis magnifica* (Vieill.); *Heteroptilorhis mantoui* (Oustalet) = *Ptilorhis magnifica* (Vieill.) × *Seleucides nigricans* (Shaw); *Paryphephorus duivenbodei* (A. B. Meyer) = *Ptilorhis magnifica* (Vieill.) × *Lophorina superba* (Penn.); *Lamprothorax wilhelminae* A. B. Meyer = *Lophorina superba* (Penn.) × *Diphyllodes magnificus* (Penn.); *Parotia duivenbodei* Rothschild = *Lophorina superba* (Penn.) × *Parotia sefilata* (Penn.); *Loborhamphus ptilorhis* Sharpe = *Parotia sefilata* (Penn.) × *Paradigalla carunculata* Less.; *L. nobilis* Rothschild = *Paradigalla carunculata* Less. × *Lophorina superba* (Penn.); *Pseudastrapia lobata* Rothschild = *Paradigalla carunculata* Less. × *Epimachus fastosus* (Herm.); *P. ellioti* (Ward) and *Epimachus astrapioides* Rothschild = *Epimachus fastosus* (Herm.) × *Astrapia nigra* (Gmel.); *Ptilonorhynchus rawnsleyi* (Diggles) = *P. violaceus* Vieill. × *Sericulus chrysocephalus* Lewin; *Paradisea mixta* Rothschild = *Paradisaea minor finschi* A. B. Meyer × *P. apoda augustae-victoriae* Cab. Apparently birds of paradise hybridize more commonly than most other Passeres, though allowance must be made for the enormous number of skins handled by the feather trade and scrutinized for oddities. This state of affairs may be correlated with the possible fact that the ♂♂ take no part in nesting duties. All the described hybrids have been ♂♂; the ♀♀ are not utilized commercially. In crossings, blue-green iridescence × dull black, or dull black × dull black, may result in violet iridescence. In "Notes on the preceding article of Dr. Stresemann," [L. W.] ROTHSCHILD (pp. 16-17) suggests that some of the hybrids may be secondary rather than reciprocal. He also discusses the status of *Paradisaea apoda granti* North.

LIFE HISTORY

18008. ALLARD, H. A. Duck hawk and the evening incoming of the starlings at Washington, D. C. *Auk* 47 (1): 82-83. 1930.—Duck hawk making unsuccessful attacks on flocks of starlings.

18009. BROOKS, W. SPRAGUE. Nest and eggs of Pisobia ruficollis (Pall.). *Auk* 47(1): 76-77. 1930.—Description of 2 nests and sets of egg from Providence Bay, Siberia.

18010. BULL, D. BERNARD. Nesting of Trudeau's tern and description of the young. *Auk* 47(3): 335-337. 1930.—In Argentina *Sterna trudeaui* nests in colonies on aquatic vegetation in lagoons. Food, eggs, and downy young are described.

18012. [DANILOVICH, A. P.] ДАНИЛОВИЧ, А. П. **Некоторые наблюдения над гнездованием обыкновенной чайки (Chroicocephalus ridibundus (L.)). [Nesting of Chroicocephalus ridibundus.]** Гидробиологический Журнал С. С. С. Р. (*Hydrobiol. Zeitschr. U. S. S. R.*) 9(4/6): 145-147. 1930.—On the Dnieper this species is found in small and scattered colonies. The earliest migrants arrive generally in late March; the main migration in 1927 took place on April 1. Eggs are laid in the 2nd half of May. Nests are of 2 types, with or without dry grass lining. The color of the eggs varies greatly.

18013. [DANILOVICH, A. P.] ДАНИЛОВИЧ, А. П. Дополнения к моим "Биологическим наблюдениям над ремезом (Remiza p. pendulina L.)" [Additional observations on Remiza p. pendulina.] Гидробиологический Журнал С. С. С. Р. (*Hydrobiol. Zeitschr. U. S. S. R.*) 9(4/6): 147-150. 1930.—Two nests are described. Near Kiev the first spring migrants are generally seen in late April. The main fall migration occurs in September. With the destruction of alder and willow growths, the species is becoming rare in this locality.

18014. DECKER, F. R., and J. HOOPER BOWLES. The prairie falcon in the state of Washington. *Auk* 47(1): 25-31. 1 pl. 1930.—*Falco mexicanus* nests on cliffs* of varying heights. It commonly uses the old nests of the western redtail and the raven and seems to gather no material of its own for nesting. Its relations with the raven are friendly; with other birds of prey, hostile. During the nesting season it feeds on cottontail and jack rabbits; during the winter, on birds. Nesting behavior, voice, and eggs are described.

18015. GILLESPIE, JOHN A. A spring flight of broad-winged hawks. *Auk* 47(1): 83-84. 1930.—About 75 *Buteo p. platypterus* moving SE., in Pennsylvania on April 21, apparently to escape a threatening rainstorm.

18016. KELSO, LEON. Weight increase of a young sparrow. *Oölogist* 49(2): 17. 1932.—Weight records for *Melospiza m. melodia*.

18017. KOHLER, LOUIS S. Two abnormal sets in 1931. *Oölogist* 18. 1932.—Notes on killdeer and catbird sets.

18018. McADOO, WILLIAM. An osprey tragedy. *Auk* 47(1): 81-82. 1930.—An osprey in Maine, struggling with a large fish it had captured, fell from a height of 60 ft. into the water and was drowned.

18019. MILLER, RICHARD F. Pennsylvania and New Jersey nesting dates for 1931. *Oölogist* 49(2): 14-16. 1932.

18020. NICE, MARGARET M. Five song sparrows raised with a cowbird. *Auk* 47(3): 419-420. 1930.—Five *Melospiza melodia melodia* and 1 *Molothrus a. ater* successfully reared in same nest.

18021. NICE, MARGARET MORSE. A study of a nesting of black-throated blue warblers. *Auk* 47(3): 338-345. 1930.—This study of a family of *Dendroica c. caerulescens* was made in Massachusetts. Four different types of songs by the ♂ are described. The ♀ brooded the young for periods varying mostly from 2 to 20 minutes. The ♂ and the ♀ fed the young with almost equal frequency, at an average of once every 5.6 minutes. Food included small green caterpillars, white grubs, white moths, and a crane-fly. Development of the young and their activities on the last day in the nest are described.

18022. OKADA, Y. K. Distribution and food of Japanese ptarmigan. *Bull. Biogeogr. Soc. Japan* 1(1): Japanese 14-24. 1 map, 1 pl., 1 fig.; English summary 25-26. 1929.—*Lagopus mutus japonicus* is limited to the central part of Hondo, where it has been reported from 60 mts. From examination of its food and from reports, it seems never to descend below timber-line. Its food consists chiefly of leaves, and next of fruits. Over 20 spp. of plants (chiefly Ericaceae) have been determined in its food. The most important sp. is *Empetrum nigrum**. The cones of *Pinus pumila** are eaten to some extent in winter.

18023. PICKENS, A. L. Favorite colors of hummingbirds. *Auk* 47(3): 346-352. 1930.—In 2 areas in the eastern United States practically all red flowers and a majority of orange flowers showed an approximately tubular flower, the form preferred by hummingbirds. Of 110 species of flowers which hummingbirds were seen to visit, 45 were red, 19 purple, and 15 orange. Birds of this tropical family may naturally be expected to

look for intensely colored flowers. Red, orange, and purple are conspicuous by daylight, and more or less invisible by night. Yellow, green, and blue flowers are inconspicuous by day. Red, in sharpest contrast to green, is probably a favorite flower color with hummingbirds everywhere.

18024. **POOLE, EARL L. Winter nesting of the barn owl.** *Auk* 47(1): 84. 1930.—*Tyto alba pratincola* nesting in Oct. and Jan. in Pennsylvania.

18025. **PRILL, A. G. History of an Oregon ruffed grouse, Bonasa umbellus.** *Oölogist* 49(2): 16-17. 1932.

18026. **RENSHAW, GRAHAM. The Mauritius dodo.** *Jour. Soc. Preserv. Fauna Empire* 15. 14-20. 2 pl. 1931.—History of the extinct *Raphus cucullatus*, with notes on restorations.

18027. **SEMPLE, JOHN B. Red-headed woodpeckers in migratory flight.** *Auk* 47(1): 84-85. 1930.—Numbers of *Melanerpes erythrocephalus* apparently crossing Lake Erie from Ontario to Ohio on Sept. 16.

18028. **SHAVER, JESSE M., and GLADYS WALKER. A preliminary study of the effects of temperature on the time of ending of the evening song of the mockingbird.** *Auk* 47(3): 385-396. 2 fig. 1930.—Field observations were made of the time of ending of the evening song of *Mimus p. polyglottos* and temperature at Nashville, Tennessee, from October 23, 1928, to April 30, 1929, a total of 65 evenings—mainly in February, March, and April—being spent in this way. The time of ending of the evening song is highly correlated with the time of sunset, the correlation being .94 ± .01. Perfect correlation would be 1.00. There is little relation between the temperature at the time of song ending and the time of ending of the evening song. The coefficient of correlation here is .27 ± .10. Maximum, minimum, mean, and normal temperatures were also found to be correlated with the time of ending of the evening song in this order: .41, .52, .49, and .81. This last correlation indicates the importance of average temperature on this activity. On the average the mockingbird sings later on warm days and stops earlier on cold days. There is no particular virtue in any one of these temperature groups over the others unless it be that of normal temperature. The correlations of song ending with maximum, minimum, and mean temperatures and with the temperature at the time of song ending are largely expressions of their correlations with normal temperature. This was indicated by eliminating the influence of normal temperature mathematically by the method of partial correlations. Neither small nor large changes in mean temperature from the preceding day are related to changes in time of ending of the song. With changes of 5° F. or more, the coefficient of correlation is .11; with all changes it is .12. The deviations of the temperature at the time of the ending of the mockingbird's evening song from the daily mean temperatures has no significant correlation with the time of ending of this song for r (coefficient of correlation) = −.11.—*Author's summary.*

18029. **SHELLEY, LEWIS O. Companionate feeding activities of a spotted sandpiper and a red-winged blackbird.** *Auk* 47(1): 78-79. 1930.—On a number of occasions an *Actitis macularia* was seen to collect caddis-fly larvae from a pool, bring them to the shore, and allow an *Agelaius phoeniceus* to eat some of them.

18030. **SUGDEN, JOHN W. White pelicans killed by lightning.** *Auk* 47(1): 72-73. 1930.—A soaring flock of 27 *Pelecanus erythrorhynchos* in Utah mostly or wholly destroyed by lightning.

18031. **WILSON, ETTA S. Interesting case of albinism.** *Auk* 47(3): 419. 1930.—Colors and habits of an albinistic *Quiscalus quiscula aeneus* [Icteridae] described.

18032. **WOOD, HAROLD B. Efficiency of propagation of barn swallows.** *Auk* 47(1): 89-90. 1930.—On an island in Rhode Island only 50 nestlings were raised from 92 eggs in 27 nests.

LOCAL AND FAUNISTIC

18033. **BALL, STANLEY C. Sharp-tailed sandpiper in California.** *Auk* 47(3): 417. 1930.—Earliest North American record (1870) of *Pisobia acuminata.*

18034. **BLAKE, EMMET R. The first appearance and breeding of the starling in South Carolina.** *Auk* 47(1): 87. 1930.—First state record in September, 1919.

18035. **BLINCOE, BEN. J. Leach's petrel in Ohio.** *Auk* 47(1): 72. 1930.—First state record of *Oceanodroma leucorhoa.*

18036. **BRADY, ETHEL W. Evening grosbeak in Delaware.** *Auk* 47(3): 420. 1930.—First state record for *Hesperiphona vespertina.*

18037. **BRODKORB, PIERCE. Notes from Illinois.** *Auk* 47(1): 97-98. 1930.—Notes on 8 forms, including first state records of *Hylocichla guttata sequoiensis.*

18038. **BURLEIGH, THOMAS D. Notes on the bird life of northwestern Washington.** [Conclusion.] *Auk* 47(1): 48-63. 1930.—This part of the annotated list treats about 56 species, special attention being given to nesting habits. *Passerella i. iliaca* is recorded as new to the state.

18039. **DANFORTH, STUART T. Notes on the birds of St. Martin and St. Eustatius.** *Auk* 47(1): 44-47. 1930.—A brief description is given of these islands in the Leeward Group of the Lesser Antilles, concerning whose avifauna very little has been previously published. The author presents an annotated list of 38 species observed during a few days in December. Practically all of the records from St. Martin represent additions to its known avifauna. Notes on food and some local names are included.

18040. **DU MONT, PHILIP A. The distribution westward of Seiurus noveboracensis noveboracensis.** *Auk* 47(1): 91-93. 1930.—Specimens recorded from Missouri, Illinois, Iowa, Wisconsin, and Minnesota.

18041. **DU MONT, PHILIP A. Rare Connecticut birds in sanctuary collection.** *Auk* 47(1): 93-94. 1930.—*Somateria mollissima borealis* and *Bubo virginianus heterocnemis,* first and second records, respectively, for Connecticut.

18042. **FLEMING, J. H. Ontario bird notes.** *Auk* 47(1): 64-71. 1930.—Notes on 37 species of unusual or otherwise interesting occurrence. *Olor columbianus* now occurs each spring on Lake Erie in numbers up to 2000; some have died from heavy intestinal infestation with a liver fluke.

18043. **GREENE, EARLE R. White pelican (Pelecanus erythrorhynchos) in Georgia.** *Auk* 47(3): 415-416. 1930.

18044. **GROMME, OWEN J. Bahama pintail in Wisconsin.** *Auk* 47(1): 73. 1930.—First state record of *Anas bahamensis.*

18045. **HACHISUKA, M. U. Avifaunal distribution in the Alps.** *Bull. Biogeogr. Soc. Japan* 1(1): Japanese 5-8; English translation 9-13. 1929.—The author lists 11 distinctly Alpine birds. Among those of northern derivation are Tetraonidae, *Lophophanes cristata, Anthus spinoletta, Turdus torquatus,* and *Acanthis linaria;* of oriental derivation, *Prunella collaris, Montifringilla nivalis, Pyrrhocorax graculus,* and *Tichodroma muraria.* The lowest boundary of the Alpine region is fixed at 394 m. near Geneva.

18046. **HASBROUCK, EDWIN M. Capture of blue goose near Richmond, Virginia.** *Auk* 47(3): 416. 1930.—*Chen Caerulescens.*

18047. **HEILFURTH, FRITZ. Two North American migrants on Las Tres Marias.** *Auk* 47(3): 423. 1930.—*Zonotrichia leucophrys gambeli* and *Circus hudsonius* on these Pacific islands of Mexico.

18048. **HOLLAND, H. M. Starlings in Knox County, Ill.** *Oölogist* 18. 1932.—Observation dates.

18049. **HÖRRING, R. Fuglene ved de danske Fyr i 1923. 41de aarsberetning om danske fugle. [The birds at the Danish lighthouses in 1923. 41st yearly report on Danish birds.]** *Vidensk. Meddel. Dansk Naturhist. For. Köbenhavn* **80: 453-516. 1926 (1925).**—This is a report on about 4600 migrating birds, killed by striking

Danish lighthouses and lightships at night in 1923. They belong to 72 species. Those most numerously represented are *Turdus iliacus,* 882; *Sturnus vulgaris,* 857; *Turdus musicus,* 475; *Alauda arvensis,* 419; and *Erithacus rubecula,* 106. A detailed list of species is given, with dates and localities. A separate list gives the nights on which the birds struck, the weather conditions prevailing at the time, and the species involved. A few data from the Faeroes are included.

18050. **HOWELL, ARTHUR H. Five additions to the birds to Florida.** *Auk* 47(1): 96-97. 1930.—*Stercorarius pomarinus, Larus leucopterus, Puffinus gravis* (first actual specimen), *Lobipes Lobatus,* and *Plectrophenax n. nivalis.*

18051. **HUDSON, GEORGE E. Two and a half years of bird migration at Clemson College, S. C.** *Auk* 47(3): 397-402. 1930.—Migration tables show the extreme dates of arrival and departure of about 100 species. A list of 50 permanent residents is also given.

18052. **JAQUES, F. L. Water birds observed on the Arctic Ocean and the Bering Sea, in 1928.** *Auk* 47(3): 353-366. map. 1930.—An annotated list of about 80 species observed from April to October during a voyage from British Columbia to the vicinity of Herald Isl. and return. *Numenius tahitiensis,* whose breeding grounds were previously unknown, appeared to be nesting near Teller, Alaska.

18053. **JEWETT, STANLEY G. Upland plover (Bartramia longicauda) in Oregon.** *Auk* 47(1): 78. 1930.—First definite state record.

18054. **LONGSTREET, R. J. Further water bird notes from the Florida east coast.** *Auk* 47(1): 95-96. 1930.—Notes on 12 species, most of them of unusual occurrence. For *Aegialitis meloda* a habit is recorded of reaching forward with either foot and beating the sand with rapid strokes, as the bird comes to a stop after a short run.

18055. **REHN, JAMES A. G. An unpublished letter of John K. Townsend.** *Auk* 47(1): 101-102. 1930.—Written in 1834 and containing notes on various birds of Missouri.

18056. **SHIPLEY, DONALD D. The broad-winged hawk in Connecticut in winter.** *Auk* 47(3): 417. 1930.—Specimen taken in January.

18057. **SMYTH, THOMAS. The dickcissel (Spiza americana) in South Carolina.** *Auk* 47(3): 421-422. 1930.—A colony of 50 near Columbia in 1928; only 1 found there in 1929.

18058. **STONE, WITMER. Townsend's Oregon Tubinares.** *Auk* 47(3): 414-415. 1930.—The yellow-nosed albatross, the sooty albatross, the giant fulmar, and the slender-filled fulmar have been kept in the North American "Check-List" for nearly 100 years on the basis of their alleged capture off the mouth of the Columbia River by John K. Townsend. Probably they came actually from the South Pacific and should be dropped from the North American list.

18059. **TAKATSUKASA, N. Geographical distribution of parrots (Order Psittaci) in Asia.** *Bull. Biogeogr. Soc. Japan* 1(2): Japanese 37-45; English summary p. 46. 1929.—The Asiatic range of the Psittaci extends north to Tibet, Yunnan, and Fokien, south to the East Indies, and west to Afghanistan. The distribution of the 3 families and 16 genera confirms the separation of the Oriental and the Australasian Regions. The Philippines are included in the latter region; they have one endemic genus, *Bolbopsittacus,* and a number of geographical spp., not races. The Lesser Sunda Isls. have numerous genera and spp. in common with New Guinea. The distribution of various genera and spp. is shown in tables.—*From author's summary.*

18060. **TOWNSEND, CHARLES W. Birds seen in the Nile valley.** *Bull. Essex Co. Ornithol. Club* 9. 5-9. 1927.

18061. **URNER, CHARLES A. The shore-bird flight of 1929 on the New Jersey coast.** *Auk* 47(3): 424-427. 1930.—Numerical records of 28 species observed during spring and fall migrations, and comparisons with numbers in 1928. The semipalmated sandpiper outnumbered all other species together.

18062. **WEYDEMEYER, WINTON. Four new birds for Montana.** *Auk* 47(1): 98-99. 1930.—Sight records of *Aegialitis semipalmata, Cypseloides niger borealis, Selasphorus alleni,* and *Dendroica fusca.*

18063. **YAMASHINA, YOSHIMARO. The avifaunal distribution of North Japan.** *Bull. Biogeogr. Soc. Japan* 1(2): Japanese 57-64. 1 col. pl.; English summary 65-66. 1929.—The territory north of the Blakiston Line (between Hondo and Hokkaido) is discussed. The avifauna of the Kurils includes 231 spp. and subspp. Hokkaido has 63 forms not found in the Kurils; the latter have 30 forms not found in Hokkaido. A line of zoogeographical demarcation can therefore be drawn between Hokkaido and Kunashiri. Eight forms are distributed throughout Kamchatka to Hokkaido. Two subspp. have a restricted range in the Kurils. Nineteen forms are common to the Kurils and Hokkaido. From Shinshiku Isl. northward, Kamchatkan spp. prevail. The group of islands from Kunashiri to Uruppu is suggested as the southern Kuril region. The northern Kuril group is again divided between Karumukotan and Onnekotan Isls. The primary line, between Uruppu and Shirihoi, joins with the Soya Line, between Hokkaido and Saghalin. Nine spp. migrating to northern Hondo do not cross the Blakiston Line. Hokkaido has 21 summer visitors not found in Saghalin. Two winter visitors to Saghalin are not known from Hokkaido. The Soya Line is by no means less important than the Blakiston Line. There is a colored plate of *Falcipennis falcipennis.*

18064. **ANONYMOUS. Annotated list of birds observed during 1927 by the Essex County [Massachusetts] Ornithological Club.** *Bull. Essex Co. Ornithol. Club* 9. 40-53. 1927.

MAMMALIA

GERRIT S. MILLER, *Editor*

REMINGTON KELLOGG, *Associate Editor*

(See also in this issue Entries 15120, 15136, 15261, 15303, 15926, 16456, 16719, 16873, 17295, 17326, 17327, 17338, 17385, 17434, 18110, 18113, 18117)

18065. **ADLERBERG, G. Preliminary synopsis of Russian and Mongolian wild boars.** Доклады Академии Наук СССР., Сер. А. (*Compt. Rend. Acad. Sci. URSS., Sér. A.*) 1930(4): 91-96. 3 fig. 1930.—On the basis of material in the Zool. Mus. of the Russian Academy of Sciences, the author recognizes 5 subspp. of *Sus scrofa* as occurring from W. Europe to the Sea of Japan, within Russian and Mongolian boundaries: *S. s. scrofa*,* W. Europe; *S. s. attila,* Hungary to Persia; *S. s. nigripes,* Turkestan and Afghanistan; *S. s.* **raddeanus*** (p. 95), Mongolia (type in Russ. Acad. Sci.) and Transbaikalia; *S. s.* **continentalis** (*S. leucomystax c.* Nehring) (p. 96), Amur. Basin.

18066. **ALLEN, GLOVER M. Primates and pangolins from the Asiatic expeditions.** *Amer. Mus. Novitates* 429. 1-7. 1930.—A systematic account of 7 spp., based on material from South China in the American Museum, and consisting chiefly of distributional records and taxonomic discussion. Primates: *Macaca mulatta* (Zimmermann) (=*Macacus lasiotus* Gray, *Inuus sancti-*

johannis Swinhoe, *Pithecus littoralis* Elliot, *P. brevicaudus* Elliot); *Lyssodes speciosus melli* (Matschie) (=*Macacus arctoides esau* Matschie, *Pithecus pullus* Howell); *Pithecus obscurus* barbei (*Presbytis b.* Blyth) (p. 4); and *Hylobates hoolock*, first records for China (Yunnan). Nomarthra: *Manis pentadactyla* dalmanni (*M. d.* Sundevall=*Pholidotus kreyenbergi* Matschie) (p. 6); *M. pentadactyla* pusilla (*M. pusilla* J. A. Allen) (p. 7).

18067. **ALLEN, GLOVER M.** Pigs and deer from the Asiatic expeditions. *Amer. Mus. Novitates* 430. 1-19. 1930.—A systematic account of 3 Suidae and 15 Cervidae, based on material in the American Mus. from China and Mongolia. It consists chiefly of distributional records and taxonomic discussion. *Sus scrofa* ussuricus (*S. u.* Heude,=*S. gigas* Heude, *S. leucomystax continentalis* Nehring) (p. 2); *S. scrofa* chirodontus (*S. c.* Heude, =*S. paludosus* Heude) (p. 5); *Capreolus capreolus* bedfordi (*C. b.* Thomas,=*C. melanotis* Miller) (p. 5); *Elaphodus cephalophus michianus* (Swinhoe) (=*E. michianus fociensis* Lydekker); *Muntiacus muntjak* nigripes (p. 11), Hainan, type in Am. Mus. Nat. Hist.; *M. reevesi* (Ogilby) (=*Cervulus lacrymans* Milne-Edwards, *C. sclateri* Swinhoe, *Muntiacus lacrymans teesdalei* Lydekker, *Cervulus reevesi pingshiangicus* Hilzh., *C. sinensis* Hilzh.); *Rusa unicolor dejeani* Pousarg., emended description; *Cervus canadensis asiaticus* Lydekker (=*C. c. baicalensis* Lydekker); *C. c.* kansuensis (*C. k.* Pocock) (p. 17).

18068. **BAILEY, VERNON.** Animal life of Yellowstone National Park. 241p. Map. 3 col. pl., 67 fig. Charles C. Thomas: Springfield, Illinois, 1930. Pr. $4.00.—The abundance and tameness of protected animals in this area afford unusual opportunities for intimate studies. The author's own observations have been supplemented by reports of other naturalists. The following life zones are briefly described, with a map showing their extent in the park region: Transition (up to about 7000 ft.); Canadian (about 7000 to 8500 ft.); Hudsonian (about 8500 to 9500 ft.); and Arctic-Alpine (above 9000-10,000 ft.). Characteristic plants, mammals, and birds of each zone are mentioned. The greater part of the book is devoted to accounts of 66 spp. and subspp. of mammals, with extensive notes on such topics as local distribution, general habits, food, breeding, enemies, and economic status. The accounts of the larger game animals are especially full and well illustrated. The wild herd of bison perhaps represents a generally unrecognized mountain form distinct from the plains form. Mountain lions, wolves, and coyotes are kept reduced in numbers. The birds are more briefly treated, with notes on the habits and seasonal status of about 209 forms. A few remarks on fishes, amphibians, reptiles, and invertebrates are added. There are colored plates of grizzly bear, bald eagle, and 3 spp. of rosy finches. An index is supplied.

18069. **BORISĬAK, A., and E. BELĬAEVA.** Trilophodon (Serridentinus?) inopinatus n. sp. from the Jilancik beds of the Turgai region. Известия Академии Наук СССР., Отделение Физико-Математических Наук (*Bull. Acad. Sci. URSS., Cl. Sci. Phys.-Math.*) 1928(3): 241-252. 2 pl. 1928.—*T.* inopinatus* (p. 241) is based upon jaws, teeth, vertebrae, and limb bones. It is regarded as allied to the group recently separated as *Serridentinus* Osborn, and is referred to as *S.* inopinatus, n. comb. (p. 252). At the beginning of the Miocene the mastodons exhibited a much greater diversity of forms in Asia than in Europe. Their dispersal from North Africa, the original center of their Lower Tertiary development, was effected through Asia, with subsequent radiation to Europe and N. Amer.

18070. **[BORISĬAK, A. A.]** БОРИСЯК, А. А. Ursus spelaeus rossicus nov. n. [In Russian.] Доклады Академии Наук СССР., Сер. А. (*Compt. Rend. Acad. Sci. URSS., Sér. A.*) 1930(5): 102-104. 1930.—*U. spelaeus* rossicus* (p. 102), North Caucasus, Quaternary.

18071. **BURRELL, HARRY.** Miscellaneous notes on monotremes. *Australian Zool.* 6(4): 387-392. 1931.—Consideration of characters other than teeth, in discussing the phylogeny of the monotremes, is advocated.—*H. Burrell.*

18072. **BURT, WILLIAM HENRY.** Machaerodus catocopis Cope from the Pliocene of Texas. *Univ. California Publ., Bull. Dept. Geol. Sci.* 20(7): 261-292. 8 pl. 1931.—Emended description of this sp.* based on well preserved jaws and teeth, and hitherto unknown limb and foot bones. Generic distinctions of *Machaerodus, Megantherеon,* and *Smilodon* are tabulated and discussed, as well as relationships with other machaerodonts.

18073. **DAVIES, GLYN.** An unusual sex-ratio in red deer. *Nature* [*London*] 127(3194): 94. 1931.—Of the 19 embryos of which the sex was determinable (taken from hinds shot by stalkers in Scotland, at least 17 of them being ♀♀ which had not borne a calf the preceding season) 18 were ♂.

18074. **DEGERBÖL, M., og N. L. NIELSEN.** Biologiske iagttagelser over og maalinger af hvidhvalen (Delphinapterus leucas (Pall.)) og dens fostre. [Biological observations and measurements of the white whale and its fetus.] *Meddel. om Grönland* 77(3): 117-144. 5 fig. 1930.—Apparently the fetus increases in length from Nov. to April, consequently most of the young are born at about this latter month, most probably in March-May. As a rule only one young at a time is born every second or most likely only every third year. In a single instance, however, three young were born at a time. For the major part of their first year the young seem to be toothless. At the end of the second or the beginning of the third year most of the teeth have worked through the gum. Apparently growth increases quickly during the two first years, about 1 m. per year, then slowly for a rather long time. The average total length of adult animals is in the males 4½ m., in the females a little below 4 m. The largest male measured 572 cm., the largest female 474 cm. In this respect the white whale is in contrast to the large whalebone whales, blue whales, and fin whales, the females of these species being on an average larger than the males. As regards the occurrence of the white whale at West Greenland, a shifting has taken place in recent years in the dates of their autumn and spring passage. For the last 3 years the whale has arrived at Sukkertoppen in the middle of Nov., formerly in the middle of Oct., and left in Jan.; formerly it did not leave until April or the beginning of May. Evidently this is no isolated phenomenon, but must be regarded as corresponding to the recent shifting in the life of other animals (cf. the abundant cod-fishing).—*From author's English summary.*

18075. **ENDERS, ROBERT KENDALL.** Some factors influencing the distribution of mammals in Ohio. *Occ. Papers Mus. Zool. Univ. Michigan* 212. 1-27. 1930.—A study of the relationship between the physiographic provinces and the distribution of mammals in Ohio. Typical habitats in each of these provinces are described with lists of the mammals taken. The distribution of the forest types is only indirectly correlated with physiographic provinces, and there are no significant differences between the mammal communities. Nor is the use of the physiographic provinces adequate to determine the distribution of the mammals of Ohio.—*C. F. Jackson.*

18076. **FLEROV, C.** The white muzzle deer (Cervus albirostris Przew.) as the representative of a new genus Przewalskium. Доклады Академии Наук СССР., Сер. А (*Compt. Rend. Acad. Sci. URSS., Sér. A*) 1930(5): 115-120. 1 fig. 1930.—PRZEWALSKIUM [Cervidae] (p. 115), type *P.* albirostre* (*Cervus albirostris* Przewalski) (p. 120). A detailed description of the sp. is added.

18077. **[FLEROV, K. K.]** ФЛЕРОВ, К. К. Пищуха Северного Урала (Ochotona from the northern Ural.] Ежегодник Зоологического Музея Академии Наук СССР. (*Ann. Mus. Zool. Acad. Sci. URSS.*) 28(1): 138-144. 1 pl., 3 fig. 1927.—*O. hyperborea* uralensis* (p. 139). Skulls are also figured.

18078. **FLORERICKE, KURT.** Wisent und Elch: Zwei urige Recken. 78p. 15 fig. Franckh'sche Verlagshandl. Stuttgart, 1930.—The wisent is described and compared with aurochs and bison. The author discusses primitive

and recent distribution of wisent and elk (Alces), including American moose; historical factors affecting fluctuations in numbers since earliest records; present status throughout the range; hunting methods; food habits; life history; and present needs for their conservation. Various geographic races are discussed.—*O. J. Murie.*

18079. GOLDMAN, E. A. The coyote-archpredator. *Jour. Mammalogy* 11(3): 325-335. 1930.—In recent years coyotes have considerably increased their range in North America. Their depredations lead to serious loss of domestic stock and damage to game and fur-bearing animals. By carrying rabies they are a menace in several western states, to human life as well as to live stock. They do not suffice to control the excessive increase of injurious rodents, and their value in the elimination of unfit individuals of wild spp. valuable to man may be greatly exaggerated. Poisoning, though objectionable, is the most effective known method of control.—*L. R. Dice.*

18080. [GROMOVA, V. I.] ГРОМОВА, В. И. О типе Bison priscus Bojanus. [The type of Bison priscus.] Доклады Академии Наук СССР., Сер. А. (*Compt. Rend. Acad. Sci. URSS., Sér. A.*) 1930(17): 459-462. 1 fig. 1930.—Bojanus' name was based upon 5 specimens from various localities. The author designates as type a specimen* in the Zool. Mus. Russian Acad. Sci. (the first on Bojanus' list), thereby rejecting Hilzheimer's selection of the Lombard specimen in the Pavia Mus. The former specimen was brought by Gmelin from the Lena region of Siberia, not the Anadyr region, as Bojanus and others have supposed. A complete redescription is given.

18081. HALL, E. RAYMOND, and HANDEL T. MARTIN. A skull of Nothocyon from the John Day Oligocene. *Bull. Univ. Kansas, Sci. Bull.* 19(2): 283-285. 1 pl. 1930.—Description of specimen of *N. lemur** (Cope) from Oregon, including associated upper and lower teeth; also critical notes on several other spp. of *Nothocyon.*

18082. HALL, E. RAYMOND. A new subspecies of Peromyscus, from San José Island, Lower California, Mexico. *Proc. Biol. Soc. Washington* 44: 87-88. 1931.—*P. eremicus* **cinereus** (p. 87), type in Mus. Vert. Zool., Univ. of California.

18083. HARMER, SIDNEY F. The false killer dolphin. *Nature* [*London*] 127(3193): 60. 1931.—The author doubts that *Pseudorca crassidens* is on the verge of extinction, and quotes various records of occurrence in widely separated regions.

18084. HELBING, H. Carnivoren aus der miocänen Molasse der Schweiz. *Eclogae Geol. Helvetiae* 21(1): 232-244. 13 fig. 1928.—Discusses and figures 5 carnivorous teeth from the Swiss Miocene.—*W. Berry.*

18085. HELBING, H. Carnivoren aus dem Miocän von Ravensburg und Georgensgmünd. *Eclogae Geol. Helvetiae* 21(2): 377-385. 5 fig. 1928.—Brings together the description of 4 carnivores from the Miocene Molasse of Switzerland.—*W. Berry.*

18086. HEPTNER, W. G. Notizen über die Gerbillinae (Mammalia, Muridae) IV. Über die Benennung der transkaukasischen Wüstenmäuse der meridianus-erythrourus-Gruppe. *Zool. Anz.* 94(9/10): 273-276. 1931.—The desert mouse from the Transcaucasus has been known as *Meriones caucasicus* Brandt but this name is now described for the first time as *M.* **caucasius** (p. 275) (Heptner ex Brandt), Transcaucasia (type) and Persia. Type in Zool. Mus. Univ. Moscow.

18087. KEELER, CLYDE E. The laboratory mouse. Its origin, heredity, and culture. 81p. 36 fig. Harvard Univ. Press: Cambridge, 1931.—A brief statement of the geographical distribution of the mouse is followed by an account of the antiquity of the fancy mouse. Dominant spotting, albinism, and waltzing all were recorded before the present era; other breeds were distinguished much later. Since in the classical literature the same word, *Mus,* was used for both the mouse and the rat, it is possible to determine which is meant only from indirect evidence. Some 24 breeds of mice are described briefly and a table is given of 27 varieties, giving for each the fanciers' term, the scientific term, and the genetic formula. The genetics of normal and abnormal inheritance are considered, and a chapter given on the laboratory breeding and care of mice. 21 life-size figures, in black and white, indicate the habit and coat color in the several breeds.—*H. H. Donaldson.*

18088. LEUTHARDT, F. Neue Funde von Resten grosser Huftiere aus dem Diluvium der Umgebung von Liestal. *Eclogae Geol. Helvetiae* 22(2): 162-165. 1929.—Describes the new finds of *Cervus claphus Linné* and *Bison priscus* H. v. Meyers.—*W. Berry.*

18089. MACPHAIL, J. G. S. The Bandala method of hunting elephant on foot. *Sudan Notes & Rec.* 13(2): 279-283. 1930.—The habits of elephants are discussed.—*W. W. Bowen.*

18090. MERTENS, ROBERT. Zwei neue Palmenroller von den Kleinen Sunda-Inseln. *Zool. Anz.* 84 (11/12): 333-336. 1929.—*Paradoxurus hermaphroditus* **rindjanicus** (p. 333), Lombok; *P. h.* **lehmanni** (p. 334), Sumbawa (type) and Flores. Types in Senckenberg Mus.

18091. MUNRO, T. M. Musquash in Scotland. *Scottish Nat.* 1931(189): 65-70. 1931.—The author reviews the spread and destructive activity of the American *Ondatra zibethica* in Central Europe. It is also likely to become a pest in Scotland, where it has been introduced.

18092. PEARSON, JOSEPH. The false killer dolphin. *Nature* [*London*] 127(3201): 340. 1931.—*Pseudorca crassidens* is regarded as a subantarctic form occasionally wandering northward in large schools into the Pacific, Atlantic, and Indian Oceans.

18093. PILGRIM, GUY E., and N. K. N. AIYENGAR. The lower canine of an Indian species of Cono(h)yus. *Rec. Geol. Surv. India* 61(2): 196-205. 1 pl. 1928.

18094. SCHMIDTGEN, O., und W. WAGNER. Eine altpaläolithische Jagdstelle bei Wallertheim in Rheinhessen. *Notizbl. Ver. Erdkunde Hessischen Geol. Landesanstalt Darmstadt.* 5(11): 58-89. 1928(1929).—The hunting site can be correlated with the terraces of Meadow Brook and associated loesses, with their loam zones, and the conclusion drawn that man in the close of the first glacial advance of the last (Würm) ice invasion was a hunter. The animal remains give a comprehensive picture of the fauna in the Rheinhessen steppe. There are bison, wolf, deer, horse, rhinoceros, pig, elephants, etc. Especially important is *Bison priscus* making up about 80% of all the animals of the chase present. Young animals dominate. Furthermore, there occur primitive tools of bone, the oldest yet discovered, which had been fashioned for skinning, cutting meat, and skin-dressing. Also there are stone tools of melaphyre and quartzite, similar to those of Mousterian age found in the terraces of Wiesback. The locality seems to have been a sort of bog where the steppe animals came to drink.—*O. Schmidtgen (transl. by B. Willard).*

18095. SCHOUTEDEN, H. Les Gorilles Congolais. *Rev. Zool. et Bot. Africaines* 19(2): 298-302. 1930.—The author reviews the distribution of the 5 races of *Gorilla* known in the Belgian Congo, pointing out that the range of each corresponds to that of some other primate. *G. gorilla gorilla* is definitely recorded from Mayumbe, though very rare there. The provenance of specimens of *G. g. uellensis* from the Uele region is maintained as authentic. *G. g. rex-pygmaeorum* is widely distributed in the great forest of eastern Congo. *G. g. graueri* and *G. g. beringei* are briefly discussed.

18096. SCHWARZ, ERNST. Ein neuer Galago vom Albert-See. *Rev. Zool. et Bot. Africaines* 19(3/4): 391-392. 1930.—*G. senegalensis* **inustus** (p. 391), Uganda, type in Congo Mus.

18097. SEREBRENNIKOV, M. Synopsis of Russian squirrels (Sciurus, Rodentia). Доклады Академии Наук СССР., Сер. А. (*Compt. Rend. Acad. Sci. URSS., Sér. A.*) 1928(20/21): 421-426. 1928.—This systematic account of 9 subspp. and 1 natio of *Sciurus vulgaris* and 1 subsp. of *S. anomalus* includes the original reference, citation of type (when known), type locality, distribution, diagnosis, and measurements of each. *S. vulgaris* **nadymen-**

sis (p. 422), Siberia; *S. v. martensi* natio altaicus (p. 422), Altai Mts. Types in Zool. Mus. Acad. Sci., USSR. Critical notes are given on *S. calotus* Auct.

18098. **SETON, HENRY.** A new Heptodon from the Wind River of Wyoming. *Proc. New England Zool. Club* 12: 45-48. 1931.—*Heptodon* brownorum (p. 45), Lambdotherium zone, on Muddy Creek, in the Wind River Basin. Type in Mus. Comp. Zool., Cambridge.

18099. **SHERWOOD, WILLIAM E.** The ways of Spilogale. *Nature Mag.* 17(4): 224. 2 fig. 1931.—Popular account of habits of the spotted skunk*, including standing and walking on its forelegs.

18100. **SHORTRIDGE, G. C.** Felis (Microfelis) nigripes thomasi subsp. nov. *Rec. Albany Mus.* [*Grahamstown*] 4(1): 119-121. 1 pl. 1931.—From Cape Province, type in Albany Mus.

18101. **SMITH, G. ELLIOT.** Validity of the genus Sinanthropus. *Nature* [*London*] 127(3200): 304-305. 1931.—*Sinanthropus* is maintained as distinct from *Pithecanthropus*.

18102. **SNYDER, L. L.** A faunal investigation of King Township, York County, Ontario. II. The mammals of King Township. *Trans. Roy Canadian Inst.* 17 (2): 173-181. 1930.—An account of 30 spp., with notes on habitats, habits, and measurements.

18103. **STANDING, H. F.** Rapport sur les ossements sub-fossiles provenant d'Ampasambasimba. *Bull. Acad. Malgache* 4: 95-100. 2 pl. 1905-06(1928).—The following are from Madagascar: *Mesopropithecus pithecoides**, genus and sp. listed here as new but published in 1908; *Archaeolemur platyrrhinus**, spp. listed here as new but published in 1908: *Hapalemur* gallieni (p. 99). A. *Chirogaleus* sp. is also described.

18104. **STEHLIN, H. G.** Bemerkung über die Hirsche von Steinheim am Aalbuch. [Notes on the stags (Cervinae) of Steinheim am Aalbuch, Württemberg.] *Eclogae Geol. Helvetiae* 21(1): 245-256. 7 fig. 1928.—Discussion of *Euprox furcatus** Hensel and *Hetroprox Larteti** Fihol.—*W. Berry.*

18105. **STEHLIN, H. G.** Ueber eine Altpleistocäne Säugetierfauna von der Insel Pianosa. *Eclogae Geol. Helvetiae* 21(2): 433-460. 14 fig. 1928.—Enumerates 6 new finds of mammals from this locality.—*W. Berry.*

18106. **STEHLIN, H. G.** Bemerkungen zur Vordergebissformel der Rhinocerotiden. *Eclogae Geol. Helvetiae* 23(2): 644-648. 3 fig. 1930.—A new specimen of *Engyodon* sp. is figured from the lower Stampien of Puy-Laurens (Tarn).—*W. Berry.*

18107. **STEHLIN, H. G.** Die Säugetierfauna von Leffe (Prov. Bergamo). *Eclogae Geol. Helvetiae* 23(2): 648-681. 9 fig. 1930.—Describes 10 different mammals from the lignite complex (Pliocene or very early Pleistocene) of Leffe. 10 spp. of Mollusca and 10 spp. of fossil plants are listed which indicate that the lignite is early Pleistocene.—*W. Berry.*

18108. **STOLTE, HANS-ADAM.** Mus spicilegus und der "Formenkreis" des Mus musculus L. Bemerkungen zu einer Arbeit von E. Mohr und G. Dunker: Vom "Formenkreis" des Mus musculus L. *Zool. Anz.* 90(7/8): 206-208. 1930.—*Mus spicilegus* is rather strictly nocturnal, and is free from the odor of *Mus musculus*. It has displaced the latter in certain places near the Baltic Sea. Cold may have the effect of hindering the relative growth of the tail. The 2 forms should be differentiated on biological rather than on morphological grounds. *M. spicilegus* is considered a good sp.

18109. **YOUNG, CHUNG-CHIEN.** Fossile Nagetiere aus Nord-China. *Palaeontologia Sinica Ser. C* 5(3): 1-82. 3 pl. 1927.—Pleistocene or subfossil remains are described of: *Spermophilus* cfr. *mongolicus; Cricetulus* cfr. *songarus; Mus* cfr. *plumbeus; M.* cfr. *rattus; Arvicola brandti; A.* cfr. *strauchi; Siphneus fontanieri; Hystrix* cfr. *subcristata; Lepus* cfr. *oiostolus; L. tolai; Ochotona daurica*. Pliocene and Upper-Miocene spp. described are:? *Tamias* wimani* (p. 8); *Castor* zdanskyi* (p. 10); *Dipoides majori** Schlos., emended description; **PARALACTAGA** (p. 13) (Dipodidae), near *Alactaga*, type *P.* anderssoni* (p. 15); *P.* major* (p. 17); **PROTALACTAGA** (p. 18), type *P.* grabaui* (p. 19); **PLESIODIPUS** (p. 20), type *P.* leei* (p. 23); *Cricetulus* grangeri* (p. 26); **PARACRICETULUS** (p. 30), type *P.* schaubi* (p. 30); *Gerbillus* matthewi* (p. 37); *Siphneus* tingi* (p. 45); *Rhizomys* schlosseri* (p. 49); *R. troglodytes** Matt. & Grang.; *Lepus* wongi* (p. 59); *L.* aff. *annectens** Schlosser *Caprolagus* brachypus* (p. 63). Their geologic range, distribution, and origin are discussed and a comparison is made with the fossil rodents of Mongolia.—*A. Schreuder.*

SYSTEMATIC ZOOLOGY

(GENERAL)

(See also in this issue Entries 15117, 15135, 15162)

18110. **BOURBON, SIXTE de, et GAËTAN de BOURBON.** Résumé des recherches zoologiques de la mission Alger-Tchad. *Bull. Mus. Nation. Hist. Nat.* [*Paris*] 1(5): 283-291. 1 map. 1929.—Brief descriptions of the regions of Hoggar, Aïr, Chad, and middle Niger, with general remarks on their fauna (especially mammals and birds). The massif of Aïr forms the approximate boundary between the Palaearctic and the Ethiopian regions. The fauna of the middle Niger is very similar to that of Chad.

18111. **GESTRO, R., e D. VINCIGUERRA.** La fauna. In: Resultati Scientifici della Missione alla Oasi di Giarabùb (1926-1927). *Fasc. 4. Notiz. Geogr.-Fis. e Biol.* 531-549. R. Soc. Geogr. Ital.: 1931.—A résumé of the results of faunal studies in this region, with discussion of its faunal affinities and with remarks on the animal groups represented. A bibliography lists the separate papers already published on the various groups.

18112. **GHIGI, A., et al.** Materiali zoologici raccolti dalla spedizione Albertini nello Svalbard Nord-Orientale. II. Elenco delle specie animali raccolte. *Boll. Zool. Unione Zool. Italiana* 2(4): 129-134. 1931.—The annotated list includes: birds determined by A. GHIGI; chironomids determined by M. GOETGHEBUER; Collembola, determined by E. CAROLI; aracnids, determined by L. di CAPORIACCO; amphipod crustacea determined by A. VECCHI; Oligochetes, determined by U. PIERANTONI; Nemathelminthes, determined by D. BRIGHENTI; Platyhelminthes, determined by D. BRIGHENTI; and Siphomedusal, determined by V. NEPPI.

18113. **KEMP, STANLEY, and A. L. NELSON.** The South Sandwich Islands. *Discovery Repts.* (*Government Dependencies Falkland Isls.*) 3: 135-190. 15 maps, 13 pl., 16 fig. 1931.—This report, while primarily geographical and geological, includes some brief notes on the fauna (chiefly seals, whales, sea birds, fishes, and marine invertebrates) and on the vegetation (algae). Information previously available on these islands was very scanty.

18114. **LUEDERWALDT, HERMANN.** Resultados de uma excursão scientifica á Ilha de São Sebastião no littoral do Estado de São Paulo, e em 1925. *Rev. Mus. Paulista* [*São Paulo*] 16: 1-75. 5 photographs. 1929.—In Sept. and Oct. of 1925, the author and Dr. Waldo Schmidt studied the fauna of the mountainous Island of St. Sebastian which is extensively covered with a primeval forest. The rich fauna of the island is closely related to that of the adjacent mainland of Brazil. Some comparisons of the author's study of this region is made with von Thering's report (1897) showing changes which have taken place and comparing the fauna of the mainland and island. One vertebrate, a rodent, *Mesomys thomasi;* a worm-like amphibian, *Siphonops insulanus*

R. v. Ihg.; and a beetle, *Hepadrinus luederwaldti* Geb. (Tenebrionidae), are 3 distinct forms not found on the continent. Three species, the woodpeckers *Colaptes campestris* Vieill. and *Furnarius rufus-badius* Licht., and the leaf-cutting ant, *Atta sexdens,* have migrated to the island since the preceding survey by von Thering. Thirty-two spp. of mammals, 22 of which inhabit the island, were recorded and observed. *Didelphyus marsupialis aurita* abundant on the mainland, is entirely absent from the island, the smaller opossums and rodents constituting the island Mammalia. The avian fauna, due to the narrow channel separating the mainland and island, is the same; 120 spp. of birds of which 30 are found on the island were recorded and observed. Fourteen spp. of reptiles of which 8 occur on the island were recorded and observed. Of the 12 spp. of amphibia found on the island only 1 Hylidae was taken. Among the insular fresh water fish, representatives of the Loricaridae, Callichthydae, Trichomysteridae, Siluridae, Cyprinodontidae, and Gymnotidae occur. A species of *Amphioxus* is very abundant on the slimy sand banks of the strand. About 108 species of insects were recorded of which only a few were taken on the island. Eleven spp. of spiders and millipeds are recorded, 3 of the former occurring on the island. Fifty-nine species live in fresh water and 8 spp. of mangrove crabs were found on the island, but *Uca morocoani* Latr. mentioned by v. Thering was not found. Mollusks are very abundant. Von Thering recorded 129 spp., the author collected 177 species. Out of 12 terrestrial or freshwater spp. 7 are on the island. One earthworm (*Eudrilus eugeniae* Kimb.), several land planarians, and 10 spp. of marine worms are recorded from the island. Twenty-three spp. of echinoderms were collected, among them *Encope emarginata* Les., and the parasite *Dissodactylus encopei* Rathb. Twenty-three spp. of Coelenterata were collected including many *Physalia, Velella, Porpita,* fewer Cubomedusae, Cerianthiidae, Actinea, Gorgoniidae. *Mussa hartti* Verrill and *Lophelia* are not rare. Coral beds are lacking. Five determined species of ascidians are recorded, *Phallusia nigra* Lav., being very abundant. About 8 spp. of marine Bryozoa were found. Sponges are very abundant. Land plants from the mainland and from the island were observed and recorded, also about 20 spp. of algae were collected; these will be reported on later.—*H. Luederwaldt (transl. by C. J. Shirk).*

18115. **WARTHIN, ALDRED S. Jr. Micropaleontology of the Wetumka, Wewoka, and Holdenville formations [Oklahoma].** *Oklahoma Geol. Surv. Bull.* 53. 1-94. 7 pl., 1 map. 1930.—This paper aims to describe most of the common microscopic fossils of a portion of the geologic column large enough to be useful in determining the ranges of the fossil species, and to include all the groups of animals which seem to be valuable in making age determinations of the strata. The author considers "microscopic" fossils those which either whole or in readily recognizable fragments will pass through a sieve having meshes 2.5 mm. square. Foraminifera, Miliolidae: **RECTOCORNUSPIRA** (p. 15), related to *Cornuspira,* type *R.* **lituiformis*** (p. 16), Pennsylvanian, Lr. Wewoka formation, also *R.* **calcarina*** (*Lituotuba c.* Waters) (p. 17), *R.* **holdenvillana*** (p. 17), Mineral Wells formation, and those species referred to *Ammodiscus* and *Lituotuba* by Moreman (*Jour. Paleont.* 4: 58-59. 1930). A key to the Carboniferous spp. of *Rectocornuspira* is given. Endothyridae: *Endothyra* **rotaliformis*** (p. 20), Up. Wetumka formation; *Bradyina* Möller (=*Glyphostomella* Cushman & Waters); *Tetrataxis corona* v. **pauperata*** (p. 26), Holdenville formation, Homer limestone member. Nodosinellidae: *Nodosinella* ? **fittsi*** (p. 27), Lr. Wewoka formation; *N.*? **delicatula*** (p. 28), Holdenville formation, Sasakwa limestone member; *Monogenerina* **grandis*** (p. 29), Oologah limestone. Bryozoa, Fenestellidae: *Fenestella* **sasakwaensis*** (p. 36), Holdenville formation, Sasakwa limestone member. Acanthocladiidae: *Septopora* ? **elliptica*** (p. 39), Wewoka formation. Rhabdomesontidae: *Rhabdomeson* **magnum*** (p. 40), Holdenville formation; *Streblotrypa* **multipora*** (p. 42), Wewoka formation. Cystodictyonidae: *Prismopora* **lobata*** (p. 43), Wewoka formation. Gastropoda. Bellerophontidae: **EUPHEMITES** (*Euphemus* McCoy, preocc.) (p. 44). Pyramidellidae: *Loxonema* **zygopleuroides*** (p. 48), *Zygopleura* **trimera*** (p. 50), *Z.* **obsoleta*** (p. 51), *Hemizyga* **nodosa*** (p. 51) and *Orthonema* **strigatum*** (p. 53), Holdenville formation. Cerithiidae: *Aclisina stevensana* v. **gibbosa*** (p. 54), Holdenville formation. Ostracoda, Aparchitidae: *Paraparchites* **latidorsatus*** (p. 55), Lr. Wewoka formation; *P.* **cuneatus*** (p. 56), Holdenville formation. Beyrichiidae: *Hollinella,* the first generic name applied to the binodate forms, originally included only those with incomplete frills. As this name was, however, the first to apply to even a stage of these forms, it must be used for the entire group, and later names for that group become synonyms. **CORNIGELLA** (p. 59), resembling *Maurgella,* type *C.* **minuta*** (p. 59), Up. Wetumka formation; *Beyrichia tuberculospinosa* Jones & Kirkby (p. 59) should also be referred to this genus. Kloedenellidae: *Jonesina* **ampla*** (p. 61), Holdenville formation; *J.* **acuneata*** (p. 61), Wetumka formation; *Kirkbyina* **laevis*** (p. 62), Wewoka formation. Kirkbyidae: *Amphissites* **wewokanus*** (p. 65), Wewoka formation. Glyptopleuridae: *Glyptopleurina*? **minuta*** (p. 67), Holdenville formation. Bairdiidae: *Bairdia* (s. str.) **peracuta*** (p. 71), and *B.* (*Bairdianella*) **sasakwaensis*** (p. 73), Holdenville formation; *Bythocypris* **rotunda*** (p. 74) and *Healdia* **bythocyproidea*** (p. 76), Wewoka formation; *H.* **elegans*** (p. 76), Wetumka formation. Cytherellidae: *Cytherella* **wewokana*** (p. 77), Wewoka formation. Types in Columbia Univ. Paleontol. coll.

18116. **WERNER, F., et al. Wissenschaftliche Ergebnisse einer zoologischen Forschungsreise nach Westalgerien und Marokko. III. Teil. Verschiedene kleinere Publikationen.** *Akad. Wiss. Wien Math.-Naturwiss. Kl. Sitzungsber. I. Abt.* 139(1/2): 1-18. 3 pl. 1930.—Following a brief introduction by F. Werner, illustrated by typical scenes, the spp. collected, with data, are recorded by the following authors: W. ADENSAMER, 25 spp. of Gastropoda: ROMAN PUSCHNIG, 3 spp. of Odonata; HANS ZERNY, 1 Neuroptera, 1 Embidaria, 1 Corrodentia; HANS REBEL, 17 Lepidoptera; O. KROEBER, 3 Tabanidae and Therevidae; PIUS SACK, 4 Syrphidae; E. LINDNER, 2 Stratiomyidae; VILLENEUVE, 8 Muscidae; MAX BEIER, 85 Coleoptera in various families; ADRIAN SCHUSTER, 67 Tenebrionidae and 24 Scarabaeidae; J. D. ALFKEN, 31 Apidae; J. C. BRADLEY, 3 Scoliidae; A. v. SCHULTHESS, 6 Vespidae; H. BISCHOFF, 3 Mutillidae; BRUNO FINZI, 24 Formicidae; KARL ATTEMS, 10 Chilopoda and Myriapoda; ED. REIMOSER, 25 Araneida.

18117. **WETTSTEIN, OTTO. Beiträge zur Wirbeltierfauna der kroatischen Gebirge.** *Ann. Naturhist. Mus. Wien* 42: 1-45. 1928.—This is a report on collections and observations made in June in the region of the Kapela and Velebit Mts. of Croatia, whose vertebrate fauna had scarcely been investigated previously. The introduction includes a description of the author's itinerary, with notes on the topography, vegetation, and general fauna. The region is marked by a general scarcity or lack of surface water. The mts. rise to about 1500-1700 m. The region is characterized by a mixture of Alpine and Balkan spp., together with some endemic spp. The systematic list of 2 fishes, 10 amphibians, 11 reptiles, 55 birds, and 28 mammals includes locality records and descriptive and taxonomic notes. In the museum at Zagreb the author noted 2 immature *Fratercula arctica* (Alcidae), taken near Fiume in July and August, and indicating a breeding station in the Adriatic. *Nyctalus maximus,* new to Croatia; *Glis glis italicus* Barr.-Hamilt. (=*G. g. postus* Montagu).

GENERAL BIOLOGY

A. H. GRAVES, *Editor,* Plant

C. A. KOFOID, *Editor,* Animal

(See also in this issue Entries 18141, 18285, 18588, 18995, 18996, 20246, 20334, 20655)

GENERAL

18118. **ANDERSON, EDGAR.** Internal factors affecting discontinuity between species. *Amer. Naturalist* 65 (697): 144-148. 1931.—The probable effect of certain characteristics on the nature of species is examined. Polyploidy, vegetative reproduction, and physiological isolation are cited and illustrated. It is concluded that the exact nature of species may be expected to vary from genus to genus and from family to family.—*E. Anderson.*

18119. **PARIJA, P.** Law of modifications. *Jour. Indian Bot. Soc.* 10 (1): 63-71. 1931.—"If an organism, an organ or even a cell is subjected to a stress, physical or chemical, the organism, the organ or the cell changes in such a way that the effect of the imposed stress is nullified." In support of this thesis, various modifications in response to light, moisture, temp., O supply, pressure, and external concentration of salts are cited.—*W. Dudgeon.*

PLANT

18120. **AJREKAR, S. L.** Some observations on the teaching of botany. *Jour. Indian Bot. Soc.* 9 (1): 66-74. 1930.—In India, teaching staffs are generally deficient and overworked, and authorities give too little attention to the needs of the botany department. There is little time or incentive for research, though some of the newer universities are remedying these defects. Students generally require financial aid to enable them to continue in universities for research. In teaching, too much attention is given to routine preparation for examinations, neglecting the broader aspects and interrelationships of the subject. Constructive suggestions are made for improvement.—*W. Dudgeon.*

18121. **BORZA, AL.** Grădina botanică şcolară. [Use of botanic gardens in teaching.] *Intâiul Congr. Nat. Naturalişt. Românía* 1: 421-437. 7 fig., 1 map. 1928 (1930).

18122. **BULLER, A. H. R.** Practical botany. viii + 275p. Longman's Green & Co.: London, 1929. Pr. 6s.

18123. **COSANDEY, F.** Création d'un jardin botanique à Sainte-Croix (Jura). *Bull. Soc. Vaudoise Sci. Nat.* 57 (226): 249-251. 1931.

18124. **DU PUY, WILLIAM A.** Our plant friends and foes. 277p. Illus. John C. Winston Co.: Philadelphia, 1930. Pr. $1.

18125. **GUNDERSEN, ALFRED.** Report on a trip to England and Northern Europe. *Brooklyn Bot. Gard. Rec.* 20 (1): 25-32. 1931.—This administrative report contains notes on the 5th Internat. Bot. Congress in Cambridge [England]; and on botanic gardens, school gardens, colony gardens, and museums in Norway, Sweden, Leningrad, and Berlin.—*C. S. Gager.*

18126. **JANCHEN, ERWIN.** Die internationale botanische Nomenklatur auf dem Botanikerkongress zu Cambridge (England). *Verhandl. Zool.-Bot. Ges. Wien* 80 (1/2): 75-83. 1930.—A discussion of activities and proposals in regard to International Rules.

18127. **JENNINGS, O. E.** Areas of biological interest in western Pennsylvania deserving preservation. *Proc. Pennsylvania Acad. Sci.* 4: 30-32. 1930.—Brief descriptions of 5 areas, with notes on some of the more interesting plants.

18128. **JUMELLE, HENRI.** Catalogue descriptif des collections botaniques du Musée Colonial de Marseille. Indochine (céréales, plantes féculentes, légumes, fruits). *Ann. Mus. Colonial Marseille* 8 (4): 1-63. 1930.—A list is given of 240 specimens (69 refer to rice) with some general notes, followed by a discussion of the chemical composition of *Diospyros kaki* and *Litchi chinensis.*—*O. A. Stevens.*

18129. **KAZIMOUR, JOSEF.** Zemědělské museum v zemědělské vědě a praksi. [Agricultural museums in theory and practice.] *Věstník Československého Zem. Mus.* 4 (3): 297-300: summaries in French p. 397, English p. 403, German p. 408. 1931.—The author emphasizes the importance of such museums, advocates their widespread organization, and describes those existing in Czechoslovakia.

18130. **LAWRENCE, WILLIAM E.** A laboratory manual for the study of general botany prepared for use at the Oregon State College. [4th ed.] 226p. Illus. State College Press: Corvallis, Oregon, 1930.

18131. **METCALF, FRANKLIN P.** An embryo botanical garden. *Nat. Hist. Soc. Fukien Christian Univ. Foochow, China* 1: 31-38. 1928.—It is planned to develop a botanical garden on the grounds of Fukien Christian Univ. Progress of the plantings with future plans are here noted.

18132. **METCALF, FRANKLIN P.** The herbarium at Fukien Christian University. *Nat. Hist. Soc. Fukien Christian Univ. Foochow, China* 2: 26-27. 1929.—The herbarium now consists of about 75,000 sheets with about 14,000 numbers. It is planned to have here the most complete collection of Fukien plants.

18133. **REGEL, CONSTANTIN.** Der botanische Garten der Neuzeit. [The botanical garden of the present day.] *Rept. & Proc. Internat. Hort. Congr. London* 9: 405-409. 1930.—A critique of present day botanical gardens, with an outline of the functions they should serve, especially in relation to horticulture.

18134. **SAMPAIO, A. J. de.** A nomenclatura botanica e o methodo de typos. *Bol. Mus. Nacional (Rio de Janeiro)* 6 (3): 1-29. 1930.—A brief review is given of the history of nomenclature since the Paris Congress in 1867, with notes on the American Code and the Type-basis Code, and accounts of the appointment of the International Committee on Nomenclature at the Ithaca

Congress in 1926, and of the literature on nomenclature following this. Then are discussed the method of types and the literature bearing upon this. The codes of 1867, 1905, and 1910 are compared article by article and the differences noted. Several recent articles on nomenclature are reviewed. A "Permanent Committee or Bureau of Nomenclature and Typification," a complete and detailed iconography of types, and an International Assoc. of Botanists for carrying out these matters, are advocated. A bibliography from 1843 to 1930 is appended. —*A. S. Hitchcock.*

18135. **WEHMER, C. Die Pflanzenstoffe, botanisch-systematisch bearbeitet. Bestandteile und Zusammensetzung der einzelnen Pflanzen und deren Produkte. Phanerogamen.** [Plant substances, botanically systematized. Elements and structure of individual plants and their products. Phanerogams.] [2nd ed.] Band 1. 640p. Gustav Fischer: Jena. [1929?] Pr. 45 M.

EVOLUTION

(See also in B. A. 6(6-7): Entries 15135, 15179, 15182, 15268, 15288, 16756, 16762, 17275, 17289, 17327, 17958; and in this issue 18118, 18144, 18148, 20193, 20374, 20566)

18136. **GUYÉNOT, E. La variation et l'evolution. Vol. II. L'evolution. ("Encyclopédie Scientifique.")** 414p. 5 fig. Gaston Doin et Cie: Paris, 1930. Pr. 32 fr.—A critical review. The parts, with their respective chapters, are as follows: (1) Can non-congenital variations become hereditary?—the problem of acquired characters, in experience; induced mutations. (2) Selection and evolution: selection, natural and experimental; variation in unicellular organisms. (3) The mechanism of evolution: the evolutionary value of mutations; the appearance of new forms by mutation; mutations and the origin of species; adaptation and evolution by mutations. (4) The difficulties of mutationism: evolution by mutations, and the documents of paleontology; the morphogenetic problem and evolution; the philosophy of mutationism. There is a bibliography (23p.), and an index.

18137. **HRDLICKA, ALES. Organic evolution. Its problem and perplexities.** *Science* 71(1835): 230-233. 1930.—An address.

18138. **KEITH, ARTHUR. New discoveries relating to the antiquity of man.** 512p. 188 illus. W. W. Norton & Co., Inc.: New York, 1931. Pr. $5.—This treatise may be viewed as a supplement to the author's "Antiquity of Man." It represents the continuation of studies and views on Ancient Man, extending particularly to the most recent discoveries. The volume in the main deals with: The Taungs skull and brain; Ancient man in So. Africa; The Galilee skull; Other finds in Palestine, Babylonia, Egypt; The Peking man; The Ehringsdorf skull; The Mammoth hunters of Moravia; and The London skull.—*A. Hrdlička.*

18139. **RITCHIE, JAMES. Scotland's testimony to the march of evolution.** *Scottish Nat.* 1930(186): 161-169. 1930.—Three lines of evidence are adduced to show that the present day fauna of Scotland illustrates the characteristic processes of evolution. Changes in the balance of life,—decrease of some species, increase of others—illustrate the accommodation or failure to accommodate of living things to changing conditions. The development of national races of domestic animals, Clydesdale horses, Ayrshire cattle, Cheviot sheep, etc., illustrates the plasticity of living things, and leads to enquiry as to whether the wild fauna has shown similar change of characters. Of the 159 birds which breed in Scotland, 32 show characters which distinguish them from the continental stock from which they sprang; also of 56 Scottish mammals, 30 now differ from their ancestral forms. These changes towards or to new species are of recent development, for Scotland was colonized by a typical section of the European fauna only after the passing away of the ice-fields of the Glacial Period, which made a complete break between the present and all earlier faunas.—*J. Ritchie.*

18140. **ROSA, D. L'ologénèse, nouvelle théorie de l'évolution et de la distribution géographique des êtres vivants.** 368p. Alcan: Paris, 1931.—The author contends that "evolution is accomplished by following dichotomously branching lines, and that each species is predetermined in the preceding species as the individual is predetermined in the egg." Neither natural selection nor the influence of the environment can be considered as true causes of evolution. Like Nägeli, Rosa attributes evolution mainly to internal causes which effect a dichotomous branching at various stages of development through the endogenous doubling of determinants. Natural selection as an evolutionary factor is not wholly discarded, but relegated to a secondary rôle, the fundamental cause of adaptation being "the internal harmony of the idioplasm."—*S. J. Holmes.*

18141. **TRETJAKOFF, D. Ursprung der Chordaten.** *Zeitschr. Wiss. Zool.* 134(4): 558-640. 7 fig. 1929.—A critical review of the Annelid theory of the phylogeny of the vertebrates leads to the adoption of one designated as the pre-annelid theory. The discovery of gastrulae in chordate development led Sedgwick to derive all segmented animals from Coelenterates. Hubrecht also pointed out phylogenetic continuities between Actinians and Chordates, but Assehton's view of gastrulation is preferred to that of Hubrecht and Keibel who deny the comparability of this process in vertebrates and invertebrates. The vertebrate gastrula is radially symmetrical, two-layered and has a true archenteron, with or without a blastopore. The hind parts of the body of a *Balanoglossus*-like animal are formed during development by a one-sided proliferation of the dorsal lip of the blastopore. The gastraea and other stages are recapitulations of ancestral characteristics. The differentiation of the nervous system and excretory organs of *Amphioxus* indicate relationship with the Ctenophores. Vertebrate phylogeny begins with the Ctenophores and shows the following steps: (1.) A Ctenophore-like animal with gelatinous tissue and a Ctenophore enteron. A stomodaeal opening serves as anus while a mouth and a tentacle are formed at the opposite pole. Coelomic cavities are formed from the stomach and the paddles change to protonephridia. There is no notochord. (2.) In the Prechordate stage a rudimentary notochord appears, and 5 coelomic sacs part from the stomach, the mouth is ventral in position between the proboscis and the 2nd neck metamere, the coelomoducts and protonephridia are unchanged, but new openings, the gill openings, appear in the posterior segment. Such an organization exists in rudimentary form at present in the Enteropneusta, Pterobranchiates and Echinoderms. Of these specialized side branches of the chordate stem, only the first two have a notochord. (3.) The Primitive Acraniates are distinguished by a reduction of the first 2 metameres, and the secondary segmentation of the 3rd which leads to the segmentation of the coelom, excretory organs and nerves. Reduction of the 2nd metamere brings the mouth immediately in front of the gill slits, which are intersegmental. The gelatinous tissue which was reduced in the Prechordates to a subepidermal layer is still present and becomes more rigid locally to form the gill skeleton and the rays of the unpaired fins. The medullary plate and the seismic organs of the first 2 stages are retained but the olfactory organ has become independent, and lateral line and individual intraepithelial sense organs are present. The enteric musculature yields the gill or visceral muscles, while the secondary coelomic cavities

(somites) give rise to the myotome musculature which displaces the mesenchymal. Ventrally the coelomic segments transform into splanchnocoele and enteric musculature. Coelomoducts and protonephridia are at the points of contact between the myotomes and splanchnotomes, the latter fusing to form the abdominal coelom. The rudiments of such an organization are retained in *Amphioxus* and in Tunicates. The former has lost the seismic organs but develops a peribranchial (atrial) cavity, while larval Ascidians retain both otolith and optic organs within the neural tube. (4.) The Protocraniates, whose characters are found in Cyclostomes and Gnathostomes, were fish-like with 7 gill slits. The first 5 gills and first 2 myotomes became obliterated, and the posterior gill gave rise to 5 new gills, which were displaced caudad, and a neobranchial region was formed. Hyalin-cartilage is present in the gills, neural vertebral arches and fins, while a gelatinous sub-epidermal layer also remains. Three primitive brain vesicles were formed and changes in sense organs occurred. The spinal nerves of the ventral (hypobranchial) parts of the myotomes fuse to form a hypobranchial nerve strand which is the origin of the later hypoglossal. From the Protocraniates were evolved the Cyclostomes, Ostracoderms and Gnathostomes.—*R. G. Schmieder.*

18142. **WEATHERALL, R.** Mortality among plants and its bearing on natural selection. *Nature [London]* 128(3218): 33-34. 1931.—A discussion of the relation between mortality of plants at various stages of development, and natural selection.

18143. **WRIGHT, SEWALL.** Evolution in Mendelian populations. *Genetics* 16: 97-159. 21 fig. 1931.—An investigation of the probability array for gene frequencies in populations of limited size under recurrent, reversible, or irreversible mutation, selection and immigration. Using q for the extent to which a series of allelomorphs is represented by a particular gene, v, and u for mutation rates to and from the gene respectively, m for the exchange of population with other populations with gene frequency q_m, s for the selective advantage of the gene over its combined allelomorphs and N for the effective size of breeding stock in the population, the most probable change in gene frequence may be written $\Delta q = v(1-q) - uq - m(q-q_m) + sq(1-q)$. The positions of equilibrium in this case (and in others involving other modes of selection) are presented. Gene frequency fluctuates about the position of equilibrium in a distribution curve which depends on the relations between population number and the various pressures. Assuming genic selection,

$$y = Ce^{4Nsq}q^{4N[mq_m+v]-1}(1-q)^{4N[m(1-q_m)+u]-1}.$$

The effect of gene frequency on Fisher's dominance ratio and hence correlation between relatives is discussed. In a large population in which gene frequencies are always close to their equilibrium points, any change in condition (other than population number) is followed by an approach toward the new equilibria at rates given by the Δq's. Great reduction in population number is followed by decrease in heterozygosis at the rate $1/8N_m + 1/8N_f$ where N_m and N_f are the effective numbers of males and females respectively. The effects of change in size of population and of intensity of selection on the mean and variance of characters is discussed. There are critical points in the neighborhood of $4Nu=1$ and $4NS=1$. The type and rate of evolution depend on the balance among the evolutionary pressures. In too small a population there is nearly complete fixation, little variability, little effect of even drastic selection and thus a static condition, modified occasionally by chance fixation of mutations, leading to degeneration and extinction. In too large a freely interbreeding population, there may be maximum variability but such a close approach to complete equilibrium of all gene frequencies that there is no evolution under constant conditions. Change in severity of selection shifts gene frequencies, reversibly, to new equilibria. Very slow irreversible evolutionary advance may be expected from the effects of qualitatively changing conditions and from the attainment of novel, favorable mutations in extended multiple series of allelomorphs. In a population of intermediate size (relative to the critical values of the coefficients), there is a continual random shifting of gene frequencies and a consequent shifting of the selection coefficients (since selection plays upon the gene systems as wholes, not on individual genes). This leads to a relatively rapid, continuing irreversible nonadaptive series of changes even under uniform conditions. The rate, however, is limited by mutation rate. Finally, in a large population, subdivided into partially isolated local races of small size, there is a continually shifting differentiation among the latter, intensified by local differences in selection but occurring under uniform conditions. This tends to bring about an indefinitely continuing irreversible, adaptive and relatively rapid evolution of the species through the results of intergroup competition.—*S. Wright.*

GENETICS

(See also in this issue Entries 18118, 18143, 18271, 18330, 18443, 19014, 19057, 19178, 19396, 19447, 19463, 19541, 19722, 19743, 19760, 19765, 19779, 19846, 19864, 19942, 19975, 19982, 20011, 20028, 20029, 20036, 20037, 20058, 20119, 20124, 20126, 20131, 20170, 20263, 20484, 20493, 20566, 21043)

GENERAL

18144. **HALDANE, J. B. S.** A note on Fisher's theory of the origin of dominance and on a correlation between dominance and linkage. *Amer. Naturalist* 64(690): 87-90. 1930.—The writer cites Fisher's suggestion that a mutant gene usually produces at first a marked effect on the heterozygote, i.e., it is dominant or partially so. Since, however, the action of the new dominant is likely to be unfavorable to survival, its dominant behavior is a disability, and natural selection tends to eliminate it. This is brought about, according to Fisher, by prolonged selection of modifying genes which change the dominant to a recessive. Haldane, on the basis of statistical evidence, believes this explanation improbable. He considers it likely that genes are of the nature of catalysts, as held by Goldschmidt, and that most observable mutations therefore involve a reduction in activity of the gene concerned. On this assumption, he shows that it is advantageous for a species to possess wild-type genes with a double margin of safety. Then if a mutation (i.e., a reduction in catalytic activity) occurs in one member of a pair, the other member can still do its work adequately. If this is true, then allelomorphs having this excess catalytic power will be favored by natural selection when in the heterozygous state with one of the above mentioned types of mutation. It is this sort of selection rather than Fisher's selection of modifying genes which is thought the more probable explanation of the dominance of the wild-type. Finally a theory of dominance must explain why in certain cases there are many more dominant mutants than recessives, and why this condition is correlated with a very small number of linkage groups as compared with the number of chromosomal pairs. Haldane believes this relationship is perhaps explainable by assuming that the dominant mutants are due not to single gene changes, but to the

translocation or duplication of whole sections of chromosomes. He thinks the cytological work of Carothers on Orthoptera tends to support this view.—*R. S. McEwen.*

PLANT

18145. ÅKERMAN, Å. Om möjligheten att genom förädling uppdraga vetesorter med bättre kvalitet. [The possibilities of breeding new wheat varieties of better quality.] *Sveriges Utsädesför. Tidskr.* 41(6): 347-359. 1931.—According to examples from Swedish wheat breeding and analyses and baking tests made at Svalöf and elsewhere, the baking quality of wheat is an heritable character and can be combined with high yield and other valuable characters.—*G. Nilsson-Leissner.*

18146. ANDERSON, E. G., and R. A. EMERSON. Inheritance and linkage relations of chocolate pericarp in maize. *Amer. Naturalist* 65(698): 253-257. 1931.—Chocolate pericarp color is due to a grayish brown pigment unlike other pericarp pigments in maize. It is inherited as a simple dominant. Tests with genes from the 9 known linkage groups gave no indication of linkage. The gene *Ch* is therefore believed to represent the remaining linkage group.—*E. G. Anderson.*

18147. ANDERSON, EDGAR, and BRENHILDA SCHAFER. Species hybrids in Aquilegia. *Ann. Botany* 45(180): 639-646. 4 fig. 1931.—A morphological analysis of 8 first generation species hybrids in *Aquilegia* revealed a general dominance of wide over narrow petals and of medium length spurs over long or very short spurs. The following chromosome counts were made from root tips: *A. flabellata* Hort. 14(2*n*); *A. chrysantha*, Gray 16(2*n*); *A. vulgaris* var. "China Blue" 16(2*n*). —*E. Anderson.*

18148. BLAKESLEE, ALBERT F. Extra chromosomes, a source of variations in the Jimson weed. *Ann. Rept. Smithsonian Inst.* 1930: 431-450. 13 pl., 6 fig. 1931.—In this summary of the types due to extra chromosomes that have been discovered in *Datura*, both earlier publications and new data have been used. A list is given of primary and secondary ($2n+1$) types together with genes which have been located in them. A table summarizes in 32 classes the number of different chromosomal forms actually identified (about 150) and gives the number theoretically possible in each class. Emphasis is placed upon compensating types in which 2 different composite chromosomes compensate to form the equivalent in chromosomal material of a whole normal chromosome, leaving the remaining non-compensating parts of the 2 composite chromosomes extra to bring about morphological changes in the plant affected. Single and double compensating types may be synthesized from tertiary (composite) chromosomes resulting from radiation treatment. Similarly pure-breeding types may be obtained with extra chromosomal material.—*A. F. Blakeslee.*

18149. DANN, BERNHARD. Über die Befruchtungsverhältnisse der Bastardluzerne (Medicago media), anderer Medicago-Arten und Steinklee (Melilotus). *Zeitschr. Zücht. Reihe A. Pflanzenzücht.* 15(4): 366-418. 5 fig. 1930.—This work is, in part, a continuation of that of Helmbold. The original group of selected plants of *M. media* was increased vegetatively and by seeds from guarded and unguarded plants. In the guarded plants, flowers were self-pollinated, others cross pollinated plus pollen from the same plant. Detailed results are given for 2 years in pairs: 1 of the pair from self-pollinated and the other from (potentially) cross-pollinated parents. These results deal with the 3 characters: (1) % seed setting under (a) self-pollinated and (b) cross-pollinated conditions; (2) pod number per fertile cluster; and (3) total relative seed weight. Measuring the results by a comparison of curves, seed-producing capacity followed closely a similar classification of the same parents by Helmbold. Sister plants from cuttings of plants derived by self-pollination and by cross-pollination from the original selects were compared as to the following characters: (1) seed setting in % from self- and cross-pollination, (2) pods per head, (3) seeds per pod, (4) seed weight per plant, (5) plant weight, (6) calculated % of (4), and (7) sterile heads in % of fertile heads. Judgment was formed from these characters as to quality of seed production of the original plants. The conclusions were in line with Helmbold's. Cross pollinated plants gave a uniformly higher seed setting % than self-pollinated. Inheritance of seed setting was followed through 2 generations from 16 original selections under the 4 possible conditions of self (or cross), following cross (or self) pollination. Seed weights obtained after natural pollination gave a better measure of such inheritance than after artificial pollination. Out of the 90 cases where a decision as to the actuality of inheritance was possible, 58% indicated positive reaction, while 42% were either negative or undecided. Seed and plant weights; counts of racemes per plant, number of pods per head and seeds per pod; and calculation of sterile florets in % of fertile, were taken on 294 plants. Only raw data are presented. Seed yield was directly proportional to plant weight, number of flower clusters and number of seeds per pod. Best seed production may be looked for in a heterozygous population properly selected.—In *Melilotus alba* a poor to fairly good setting of seed resulted in unworked guarded plants; no seed resulted in similar plants of *M. officinalis*. 22 species of *Medicago* (alfalfa excluded) were given 2 treatments: 1 series was guarded and left untouched, the other artificially self-pollinated and isolated. Seed production was excellent in both cases. A very large number of interspecific *Medicago* crosses were attempted, and also with *Melilotus*. The extremely few harvested pods probably contained selfed seed.—*L. R. Waldron.*

18150. DARROW, GEO. M. A productive thornless sport from the Evergreen blackberry. *Jour. Heredity* 22 (12): 404-406. 2 fig. 1931.—This sport of *Rubus laciniatus* is apparently a chimera. Several others are noted. The thornless tissue in all of them is evidently sterile, genetically, and productivity results only when the superficial layer of thornless tissue is very thin.—*L. M. Dickerson.*

18152. HAGIWARA, TOKIO. The genetics of flower colours in Pharbitis nil. *Jour. Coll. Agric. Imp. Univ. Tokyo* 11(3): 241-262. 1 col. pl. 1931.—So far as studied, the flower color series in Japanese morning glory include blue, purple, magenta, red, slate, gray, plum, drab, terra-cotta I, terra-cotta II, vinaceous I, vinaceous II, white and yellow; and they may be classified under the 3 groups, pure color, broken color and white. Pure color, bright in hue, contains blue, purple, magenta and red. Broken color, dull in hue, contains 8 colors under 2 classes, each of which includes 4 dull hues, corresponding to 4 normal pure colors. That is, one class, broken color I (dusky), contains slate, plum, terra-cotta I and terra-cotta II; the other, broken color II (duskish), contains gray, drab, vinaceous I and vinaceous II. In both broken color groups, however, 2 dull hues which correspond to magenta and red are so slightly different that their classification is difficult in some cases, especially in broken color II. These colors are due to anthocyanins in the cells of the corollas, while the white group has no anthocyanin in the corollas, except flower tubes, in which sometimes a full amount of anthocyanin occurs. 64 crossings determined the 4 genes—purple (pr) (formerly b), magenta (m_g) (formerly p), dusky (d_y) (formerly k^2, d_y^1) and duskish (d_k) (formerly k^2; d_y^2) which are active only with the co-existence of the other 3 complementary genes, C_a (formerly C^a), C and R, for the development of the flower color. The genetic constitution for 12 colors is as follows: In pure color group, blue ($P_rM_gD_yD_k$), purple ($p_rM_gD_yD_k$), magenta ($P_rm_gD_yD_k$), and red ($p_rm_gD_yD_k$); in broken color I, slate ($P_rM_gd_yD_k$), plum ($p_rM_gd_yD_k$), terra-cotta I ($P_rm_gd_yD_k$), and terra-cotta II ($p_rm_gd_yD_k$); and in broken color II, gray ($P_rM_gD_yd_k$, $P_rM_gd_yd_k$), drab

(*prMgDydk*, *prMgdydk*), vinaceous I (*Prmgdydk*, *PrmgDydk*) and vinaceous II (*prmgDydk*, *prmgdydk*).—*Author's summary.*

18153. KADAM, B. S., and B. NAZARETH. Inheritance of awn colour in wheat. *Indian Jour. Agric. Sci.* 1(6): 663-670. 1931.—In a cross between a black awned wheat, K.K.568 (*Triticum dicoccum*) and B. 103 (*T. durum*) with red awns, the F_1 showed complete dominance of black awn. In F_2 besides the parental awn colors, a new type with white awns appeared. The F_2 ratio was 12 black: 3 red: 1 white. In F_3 white awned plants bred true; the red awned plants segregated into 3 red: 1 white or gave entirely red awned progeny. The F_2 black awned lot consisted of plants: (1) breeding true, (2) splitting into 3 black: 1 white, (3) segregating into 3 black: 1 red, and (4) throwing all the 3 colors in the proportion of 12 black: 3 red: 1 white. Thus the black and red colors are due to 2 independent dominant genes, designated as *B* and *R*, respectively. *B* is epistatic to *R* and modifies the usual digenic ratio. White awns are due to recombination of recessives in F_2.—*B. S. Kadam.*

18154. LEHMANN, ERNST, und JULIUS SCHWEMMLE. Genetische Untersuchungen in der Gattung Epilobium. *Bibliotheca Botanica* Heft 95. 1-156. 18 pl., 106 fig. 1927.—The purpose of the investigations is to study the genetic conditions existing in a genus closely allied to *Oenothera*. Part I deals with reciprocal hybrids. Most reciprocal hybrids in *Epilobium* are similar, unless *E. parviflorum* or *E. hirsutum* is used as the ♀ parent. In these cases the hybrid is either not obtained or else is extremely reduced and almost always sterile. Plants of the same species from different localities (*E. roseum*, B. G. and *E. roseum*, F. A.) are crossed with *E. parviflorum* as the ♂ parent, and the hybrids obtained are found to differ in degree of fertility and reduction of flower parts. *E. roseum*, B. G. × *parviflorum* is sterile while *roseum*, F. A. × *parviflorum* is fertile. The F_1 crossed with *parviflorum* as ♂ parent also shows different degrees of fertility. When the cytoplasm of the F_1 plant has been received from *roseum*, B. G., there are more sterile than fertile plants resulting from the F_1 cross with *parviflorum*, whereas when *roseum*, F. A. is the ♀ parent of the F_1, there are more fertile than sterile plants resulting from the cross with *parviflorum*. In both these cases the nuclear combinations are the same but the cytoplasm is different. *E. roseum*, B. G. crossed with *roseum*, F. A. gives fertile offspring in both directions. Therefore there cannot be a factor in the cytoplasm of *roseum*, B. G. which causes complete sterility, but the shift towards sterile in the ratio 1 fertile: 1 sterile must be due to the influence of the cytoplasm of *roseum*, B. G. This is best explained by use of the following symbols: if it is assumed that there is an *I*-factor (inhibiting factor) in the nucleus of *roseum*, B. G. which is stronger than that in the nucleus of *roseum*, F. A., then the nuclear composition of the two *roseum* strains would be I_1I_1 and I_2I_2, where I_1 is a stronger inhibiting factor than I_2 and the corresponding cytoplasms would have corresponding degrees for inhibiting—albeit of lesser intensity than the inhibiting factors in the nuclei. Then let *pp* equal the nuclear composition of *E. parviflorum*, and let I_1p be a sterile plant and I_2p a fertile plant. Then $I_1I_1 \times I_2I_2$ gives I_1I_2, and $I_2I_2 \times I_1I_1$ gives I_2I_1, both fertile plants; but $I_1I_2 \times pp$ gives I_1p, a sterile plant, and I_2p, a fertile plant in an expected ratio of 1 fertile: 1 sterile. But since the cytoplasm of I_1I_2 has been received from I_1I_1, its egg cells will be composed of cytoplasm with a greater inhibiting effect and there will be more sterile plants than fertile from the cross $I_1I_2 \times pp$. Similarly $I_2I_1 \times pp$ gives I_2p, a fertile plant, and I_1p, a sterile plant, but since the cytoplasm of I_2I_1 has been received from I_2I_2 it will form egg cells with cytoplasm of a lesser inhibiting effect and there will be more fertile than sterile plants from the cross $I_2I_1 \times pp$. $I_2I_2 \times pp$ would then give all fertile plants and $I_1I_1 \times pp$ would give all sterile. In vegetative characters alone matrocliny is shown. Large flower size and dark leaf color are dominant in interspecific crosses. Probably these laws may be applied to all reciprocal crosses in the genus *Epilobium*. Part II deals with the F_2—F_5 of the cross *E. montanum* × *E. parviflorum*. Many characters show Mendelian inheritance, some being of a very complex factorial nature. From the F_3 on, exceedingly uniform strains occur which give the impression of new species. The low fertility of some would seem to point to what are called "hybrid species," as in *Oenothera*. Such uniform strains arising from a widely segregating F_2 may be due to elimination of either zygotic or gametic lethals. It is strange that the strains have become uniform so quickly, however, since *Epilobium* possesses 18 haploid chromosomes which would permit a great many combination possibilities. Part III deals with a *gigas* form from *montanum* × *parviflorum*, isolated from the F_3 arising from the F_2 *"formosum"* strain. Pollen grains show extra germ pores, the nuclei are twice the size of the parent species, but the chromosome number is only 18 for the haploid. Seeds were not obtained from the original *gigas* but backcrosses were made showing offspring of varying forms. Irregular pollen formation, characterized especially by extra germ pores, accompanies *gigas* characters.—*M. S. Cave.*

18155. MALHOTRA, R. C. The sex ratio in Asparagus officinalis L. and its artificial modification. *Jour. Genetics* 23(2): 157-172. 5 fig. 1930.—In the varieties Mary Washington and Palmetto, grown in California, there was a lower % of staminate plants than pistillate. Plants grown from seed and from 1-5 year-old beds averaged about 29 ± 3% staminate and 65 ± 5% pistillate plants. Mary Washington, considered the more desirable variety, usually had the lower % of staminate plants. Because staminate plants yield better than pistillate, it is desirable to increase the % of staminate plants grown in the field. The lower % of staminate plants was shown to be due to lack of a proper amount of volatile oils in the pollen before pollination. From pollinations made on plants of the Mary Washington variety with pollen which was allowed to stand 6, 12, and 24 hrs. before using, proportionately lower percentages of staminate plants were obtained. By using pollen sprayed with an extract of the volatile oil, the percentage of staminate plants of the same variety was increased 26 ± 1%.—*M. C. Gillis.*

18156. MARSDEN-JONES, E. M., and W. B. TURRILL. Flower mutations in the primrose. I. Origins and genetics. *New Phytologist* 30(4): 284-297. 33 fig. 1931.—In *Primula vulgaris* different plants show (a) enations on the corolla lobes, (b) hypogynous organs of varied structure, etc. It is shown that both enations and metamorphosed organs are recessive to the normal and that segregation occurs in F_2. Breeding results suggest that an allelomorph of one gene is responsible for suppression of normal stamens and occurrence of a wide range of metamorphosed organs. Figures are given for heterostyly.—*G. S. Avery, Jr.*

18157. NEETHLING, J. H. Will the inhibitor (dwarfness) throw new light on the "multiple factor hypothesis" of quantitative characters? *So. African Jour. Sci.* 26: 170-183. 1929.—This paper reports a genetic study of "dwarfness" in wheat and its interpretation as related to the multiple factor hypothesis. Dwarf segregates appeared in F_2 from a cross of Normal × Normal. Dwarfness is due to the interaction of an inhibitor *"II"* with factors for normal height (*B B*, B_1B_1, etc.) carried by the opposite parent. When height factors (*A A*, A_1A_1, etc.) carried by the same parent in which the *"I"* factor is located are present, normal height is attained. It is concluded that only 1 pair of factors of the *A A* sort are present and possibly 2 factor pairs *B B* and B_1B_1, which are affected by the inhibitor, *I I*. This interpretation of the inheritance of a quantitative character is contrasted with the general conception afforded by the multiple factor hypothesis.—*M. C. Gillis.*

18158. OSTENDORF, F. W. Polyfyllie bij Hevea brasiliensis. [Polyphylly in Hevea.] *Arch. Rubbercult. Nederlandsch-Indië* 14(6): 251-259. [English summary.]

3 pl. 1930.—Polyphylly is not uncommon in several clones of *Hevea*. Lateral and median splitting of side leaflets occurs in most of the cases. The occurrence of leaves with 6 leaflets is a distinct phenomenon close to fasciation. Improved food conditions and heredity are responsible for most of these abnormalities.—*L. S. Moyer.*

18159. PARTHASARATHY, N. A note on Oryza sativa var. (plena) Prain. *Madras Agric. Jour.* 19(7): 290-294. 1 pl. 1931.—Characteristic of this variety are 2-4 and rarely 5 pistils in each spikelet instead of 1, usual in common rices. The number of developed rice kernels is 1-3 in each developed paddy grain. Normally, only the rice formed from the developed ovule adjacent to the flowering glume germinates; the others, though viable, are suppressed by the palea. The seedlings from these rices attain equality of growth after the first fortnight from sowing, though the seedlings from single rice have a higher rate at the start. The inheritance of multipistillate nature is a simple recessive. This variety may have originated from cultivated rice by mutation, as the evolutionary tendencies in cultivated rices show a change towards close aggregation and simplification of floral parts, resulting in suppression of intervening glumes and leading to doubling of pistils. This advance is not advantageous in this variety, as it is handicapped by the successive suppression of normal growth of seeds other than the first.—*N. Parthasarathy.*

18160. SINNOTT, EDMOND W. The independence of genetic factors governing size and shape in the fruit of Cucurbita pepo. *Jour. Heredity* 22(12): 381-387. 3 fig. 1931.—Sharp segregation in F_2 of fruit shapes into $\frac{3}{4}$ disks and $\frac{1}{4}$ spheres occurred after crossing pure lines. F_2 spheres are significantly larger than parental spheres, F_2 disks significantly smaller than parental disks, and the F_2 spheres and disks essentially equal in size. The variability in weight of the F_2 is significantly higher than that of the F_1. A single factor for shape and a series of multiple factors for weight are suggested, the factors for controlling shape being independent of and different in character from those controlling total size or volume. Particular dimensions of the fruit are regarded as resultants of the interaction of the factors for shape and volume.—*L. M. Dickerson.*

18161. TSCHERMAK, ERICH. Über die praktische Verwertbarkeit der Weizen-Roggenbastarde. *Deutsche Landwirtsch. Presse* 58(3): 29-30. 1 fig. 1931.—Bokhara wheat × rye hybrids were made and F_1 was backcrossed to both parents. In either backcross, segregation gave fully fertile wheatlike types, F_1-like plants, and, in rare cases, an almost sterile rye-like type. By twice backcrossing to rye, sterility increased, with fewer rye-like types. It was possible to combine the hairiness of neck and drought resistance of rye in fertile hybrids. H. von Berg found 42 chromosomes in these intermediate types. They are resistant to brown leaf rust of rye and susceptible to black stem rust of wheat. Certain hybrid strains are satisfactory for yield and baking quality and may replace rye on the less fertile rye soils.—*H. E. Brewbaker.*

18162. WARREN, ERNEST. A statistical study of certain interspecific plant hybrids and backcrosses. *Ann. Natal Mus.* 6(3): 363-414. 8 pl. (1 col.) 1931.—This paper deals primarily with the relationship of the F_2 of a hybrid daisy (*Venidium wyleyi* (♀) × *Arctotis stachadifolia* var. *grandis* (♂)) to the grandparental species. Typical segregation could not be detected in any of the characters studied, but a definite bias towards one or the other grandparent was frequent. When this bias is strong a condition of segregation is approached, and when weak a perfect blending of characters results. For comparison of the different generations, "coefficients of divergence" were employed. For any character, the coefficient of divergence from one of the parents is the ratio of the difference of the offspring from that parent to the difference between the 2 parents. The mean of the summation of these coefficients for a series of characters is a measure of the general relationship of the offspring to the parents, and in this way a series of hybrids may be compared on a numerical basis.—*E. Warren.*

18163. WATKINS, A. E., and F. M. CORY. Genetic and cytological studies in wheat. V. *Jour. Genetics* 25 55-90. 1931.—Analysis of *T. vulgare* ($x=21$) × *T. turgidum* ($x=14$) is continued. The factors *R* and *r* for rough and smooth chaff, *Re* and *re* for red and white chaff, *W* and *w* for waxy and waxless foliage, *B* and *b* for beardless and bearded, *K* and *k* for keeled and rounded glume and other characters, are carried by paired chromosomes. All gave regular 1:1 ratios when F_1 ♀ was back-crossed, and none had any effect on pollen sterility or grain germination. *K* and *B* are linked, and *Re* and *W* could not be tested together, but at least 3 different chromosomes must be involved. Allosyndesis is the rule for this particular hybrid, but autosyndesis occurs occasionally. If the fully fertile F_1 ♀ is backcrossed, the parental types are regained in a high % of cases, showing that at least 11 and perhaps 12 of the chromosomes of the 2 species are closely similar. Inheritance of waxy and waxless foliage was followed in detail. Factors involved are *W* and *w*, carried by paired chromosomes, and W^1 by an unpaired chromosome; *vulgare* = $(ww)\,W^1W^1$, *turgidum* = (WW), $F_1 = (Ww)\,W^1$. *W* and *w* pair regularly and W^1 is only occasionally paired. If F_1 pollen is used on *turgidum*, we obtain (1) well filled grains, with 28 chromosome embryos, and (2) wrinkled grains with embryos containing 29-35 chromosomes. Plants obtained from (1) are either (WW) or (Ww) and therefore breed true or give 3:1 ratios. The heterozygous plants obtained from (2) are either (Ww) or $(Ww)\,W^1$ and therefore give ratios of about 5:1 as well as 3:1. From $(Ww)\,W^1$ we obtain the new type $(ww)\,W^1$, which gives about 1 waxy:2 waxless. If all the progeny of $(Ww)\,W^1$ are followed, they are found to give true waxy, 3:1, 5:1, 1:2, and true waxless families in about the expected proportions 3:4:2:1:2. Although waxless plants are derived as a matter of course when the F_1 is crossed back to *turgidum* and the progeny bred, when F_1 is crossed back to *vulgare* we obtain as a rule only waxy plants which breed true to waxy. This is because it is only rarely that plants lacking both W^1 chromosomes are produced. A few such waxless plants were found, and these, as expected, were dwarf and sterile. Fertile waxless *vulgare*-like plants occur occasionally as a result of W^1 pairing with *w* in a plant of the constitution $(ww)\,W^1$ instead of remaining unpaired; such plants occur to the extent of about 0.3%. A few families gave aberrant results, sometimes in consequence of natural crossing. Inheritance in this pentaploid wheat hybrid, however, follows principles already worked out.—*A. E. Watkins.*

ANIMAL (EXCEPT MAN)

18164. ANDERSON, RUTH. The multiple somatic effects of the bar gene in Drosophila melanogaster. *Amer. Naturalist* 65(701): 558-564. 1 fig. 1930.—To determine the extent to which the entire organism is affected by a single gene change, the unit factor for "bar" eye was chosen. A study was made of full-eyed reversions and ultra-bar mutants in 2 strains, one with straight bristles and one in which the bristles were forked. 100 flies were counted and measured in each of the 6 strains used. The environmental conditions were kept constant and a uniform temp. of 27° was used throughout the experiment. The primary effect of the bar gene is a reduction in facet number to approximately 16% of the number in the full-eyed type. Ultra-bar again reduces the number to about 16% of that found in bar. In addition to the reduction in facet number, there is a graded decrease in size of the flies of bar and ultra-bar stocks as compared to the full. This size difference is most noticeable in the head width, thoracic length, wing length, circumocular hairs and median ocellus. A difference of the same order but to a lesser degree is found in wing width and halter length. In contrast to the decrease in size, the number of rows of acrostical hairs is increased slightly and that of the ocellar bristles to a marked

degree. The observations made on the straight-bristled stock are correlated with those of the forked strain. On the whole, forked-strain flies are somewhat smaller than straight-bristled, the only exception is a slight excess in forked ultra over straight in halter length of ♂♂ and thoracic length of both sexes. The most pronounced difference between the 2 strains is the reduction of circumocular hairs in the forked strain.—*R. Anderson.*

18165. DUNKER, H. Genetik der Wellensittiche. *Züchter* 2(5): 136-147. 6 fig. 1930.—This brings together and up to date all of the author's data, including those of cooperators, on inheritance of color and pattern in the Australian grass parakeet or Budgerigar, *Mellopsittacus undulatus*. About 4000 birds are considered, 1700 of which were raised by the author. Two pairs of factors account for the 4 chief color types: green, blue, yellow, and white. When *F* is present, yellow color is present in the periderm of the feather, absent with *f*. An oxidizing factor *O* causes melanin formation in the central pith. These 2 pairs are independent and not sex-linked. The *O* is the highest of a series of 4 allelomorphs which regulate the pattern by producing grey effects, the lowest showing ghost pattern. The brown factor *B* changes the melanin and has only half the effect in the heterozygote. *B* is linked with *F* and gave 15.5% crossing over with 695 progeny.—*B. L. Warwick.*

18166. GOLDSCHMIDT, RICHARD. Analysis of intersexuality in the gipsy moth. *Quarterly Rev. Biol.* 6(2): 125-142. 1931.—Article summarizes conclusions from 20 yrs. of work. Intersexuality in these moths depends chiefly on general sex genes, of which M for maleness is in the X chromosome (Z of many authors), and F for femaleness is maternally inherited (probably through the Y, or W, chromosome, though this involves assumption that F exerts its whole initial influence before the reduction division). Many multiple allelomorphs of F and M, differing in strength, have been found in different races of moths. Within a single pure race, F and M correspond in strength and produce only normal ♂♂ (FMM) and ♀♀ (FM). When weak and strong races are crossed in certain ways, bringing about indecisive ratios of F to M or F to MM, intersexes are produced, in varying degrees of intermediacy up to complete sex reversal in both directions. Sex-reversal ♂♂ have been shown by their progeny to be of XY genetic composition. Corresponding proof that sex-reversal ♀♀ are XX has not been obtained, owing to the poor viability and sterility of such ♀♀. Several autosomal factors modifying intersexuality have been found. Intersex starts its development as of the sex denoted by its chromosomes, but changes sooner or later to opposite sex development. When this turning point occurs depends on relative strengths of F and M; early occurrence produces high degree, late occurrence low degree, of intersexuality. Embryonic development confirms this view, in general, since, with the exception of antennae, the organs differentiated early are changed little in the intersexes, those differentiated late are changed much. Strength of genes is held to be due to quantity; alternative theories of plus and minus modifiers are rejected. —*A. F. Shull.*

18167. GREEN, C. V. Genetic linkage in size inheritance—a reply. *Amer. Naturalist* 66(702): 87-91. 1932.—Castle's extra-chromosomal interpretation of the association in heredity between quantitative characters and a qualitative, brown coat color, in a mouse interspecific cross, which was observed by the author and interpreted as genetic linkage, is considered. Castle's assumptions that the recessive qualitative characters tend to remain together in their parental association and that whatever causes them to go together also causes the larger size of the recessive parent to go with them, are not substantiated by the data. F_2 and back-cross animals show only free assortment, thus weakening his 1st assumption, while the validity of the 2nd is diminished since triple recessive animals (larger parent type) are no larger than those with the recessive gene for brown coat color in other combinations. It is still believed that genetic linkage offers the best explanation for the observations.—*C. V. Green.*

18168. HACHLOV, V. Über die Genetik der Hunde. *Züchter* 2(9): 261-263. 1 fig. 1930.—The genes *B* for coffee brown and *Q* for marbling are linked. This is based on the results of crossing short-haired marbled × pointer, and mating the F_1 with the different types. Eighty progeny were studied.—*B. L. Warwick.*

18169. HANSON, FRANK BLAIR, FLORENCE HEYS, and ELIZABETH STANTON. The effects of increasing x-ray voltages on the production of lethal mutations in Drosophila melanogaster. *Amer. Naturalist* 65(697): 134-143. 1931.—The mutation rate increases with the increase of x-ray voltages from 40-99KV. The secondary β-rays are responsible for the mutations.—*C. V. Beers.*

18170. HERTWIG, PAULA. Was wissen wir über die Vererbung der Nutzeigenschaften bei den Haushühnern? *Züchter* 2(2): 44-50. 1930.—A review of the knowledge of inheritance of egg production, broodiness, early maturity, winter pause, autumnal molt, egg size, hatchability, body weight and rate of feathering.—*B. L. Warwick.*

18171. HOLLEBEN, HEINRICH von. Vererbungsversuche an reziproken Kreuzungen mit Karakul-, Merino-Fleisch- und Hampshire-Down-Schafen unter besonderer Berücksichtigung des postembryonalen Zustandes bis zum Alter von 45 Tagen. *Wiss. Arch. Landwirtsch. Abt. B. Arch. Tierernähr. u. Tierzucht.* 6(1): 98-150. 26 fig. 1931.—In the main, the findings of Adametz on inheritance of color characters in Karakuls have been substantiated. In crosses of Karakuls and Hampshires, the F_1 as well as the progeny of both back crosses show a loss of coat color with advancing age. The grade of wool appears to behave in the main as a monohybrid. In Karakul-Merino crosses, the finer grades are obtained more frequently in F_1 than in the Karakul-Hampshire crosses. The results of Adametz relating to inheritance of color pattern were confirmed in Karakul-Merino crosses. Hampshires appear to carry no factor for formation of white spots. The appearance of kinkiness in back crosses with Merinos and Hampshires indicates an incomplete dominance of Karakul kinkiness. In the genetic sense, there is no linkage between pigment and kinkiness. However, the deposition of pigment favors the development of curliness, a relationship presumably associated with physiology of development.—*H. von Holleben (transl. by A. H. Kuhlman).*

18172. KOLLER, P. On pigment formation in the D-black rabbit. *Jour. Genetics [Cambridge]* 22(1): 103-107. 1930.—It has been shown by various workers that melanic pigment in animals and plants is due to the action of an oxidase, tyrosinase, on a colorless chromogen. Onslow ('15) working with tyrosinase and peroxide was able to demonstrate that chemical differences exist corresponding to the differences in genetic behavior between the dominant and recessive white of rabbits, the dominant white being due to an inhibitor of color, and the recessive to a deficiency in the color producing mechanism. The present investigator attacked the same problem, using dioxyphenylalanine ("Dopa") as a reagent, and testing the effect not only on the coat colors studied by Onslow, but also on certain others, notably dominant black. An extract was obtained from pulped skins of the types to be tested, and a similar extract was also made of skin presumed to contain an inhibitor of color, such as that from the white belly of an agouti. In each case the extract of the skin to be treated had added to it, Dopa alone, Dopa plus water as a control, and Dopa plus extract from skin containing the inhibitor. Under these conditions extracts of white skin, both dominant and recessive, showed no pigment at any time. Extracts of agouti and of recessive black and chocolate showed pigment on addition of Dopa, but it vanished when extract of inhibitor also was added. The color produced by

dominant black plus Dopa, however, did not disappear upon addition of extract of inhibitor. It is held that these results support the conclusion arrived at on genetic grounds, that dominant white of agoutis results from an inhibitor, and that dominant black is caused by an inhibitor of this inhibitor.—*R. S. McEwen.*

18173. **KOSSWIG, CURT.** Die Bedeutung des Y-Chromosoms im Tierreich. *Züchter* 2(9): 263-269. 4 fig. 1930.

18174. **LOEB, LEO, and HELEN DEAN KING.** Individuality differentials in strains of inbred rats. *Arch. of Path.* 12(2): 203-221. 1931.—In these experiments, which represent a continuation of former investigations, the authors used tissues from strains A and B, inbred through 60-67 generations by matings of brother and sister rats. The results of transplantation of tissues from strain A to strain B corresponded to the results of ordinary homoiotransplantation. Transplantation between different litters within inbred strain A likewise gave results very similar to those obtained in homoiotransplantation, and this was true of grafts of thyroid gland, as well as of those of cartilage. Transplantation between different litters within inbred strain B gave better results, but even these results remained far behind those obtained in ordinary syngenesiotransplantation from brother to brother. As was to be expected, transplantation to different litters in group (A × B) F_4 or F_5 led to marked homoioreactions. Transplantation from (A × B) F_4 to one of parent strains or vice versa gave results corresponding to or approaching homoioreactions; but in accordance with expectation the results were somewhat better in transplantation from parent to hybrids than in the reciprocal transplantation. However, it is doubtful whether this difference is sufficiently great to be of significance. Multiple simultaneous transplantations in brothers of inbred strain B, under conditions of approximate identity of the individuality differentials of hosts and donor, confirm our former conclusion that a deficit in internal secretion of the thyroid gland is not necessary for the preservation of the thyroid transplant. Much more unfavorable results than in transplantation within the same litter in strains A and B were obtained in brother to brother transplantation in (A × B) F_4 hybrids. On the other hand, the results here were somewhat better than in ordinary homoiotransplantation. It is concluded that, notwithstanding continued inbreeding in strain A and strain B, a condition approaching a homozygous genetic constitution within the same strain has not been attained. On the contrary, the results indicate much more marked heterozygous constitutions after inbreeding in rats through from 60 to 70 generations than Loeb and Wright found in guinea pigs after inbreeding of these through a much smaller number of generations. There is, however, some indication that a slight advance toward greater similarity of the individuality differentials within the same strain has been made since the first transplantations, in which animals belonging to generations 30 to 47 were used.—*L. Loeb.*

18175. **McPHEE, HUGH C., E. Z. RUSSEL, and JOHN ZELLER.** An inbreeding experiment with Poland China swine. *Jour. Heredity* 22(12): 393-403. 3 fig. 1931.—An attempt to establish an inbred strain of Poland China swine by brother-sister matings failed in F_2 due to a decrease in fertility and high mortality. In the 1st inbred generation, litter size did not significantly decrease, but average birth weight and % of pigs reared to 70 days of age were less than in control stock. In the 2nd generation, litter size and the vigor of the pigs were greatly reduced. The % of still-births was slightly higher among inbred than among control stock. The % of ♂♂ was greater also. A recessive gene for dilution of black coat color to sepia, apparently linked with white spotting, was indicated. Other characters inherited but not demonstrated in detail are cleft palate, scrotal hernia, and the ridgeling. There is no basis for assuming that the results of this experiment are typical of the entire Poland China breed.—*Authors' summary.*

18176. **NACHTSHEIM, HANS.** Eine Methode zur Prüfung der Lebensdauer genotypisch verschiedener Spermien bei Drosophila. *Zeitschr. Indukt. Abstam. -u. Vererb. Supplementb.* 2: 1143-1147. 1928.—Experiments were conducted on ♀♀ of *Drosophila melanogaster, D. simulans,* and *D. obscura,* to determine how far sperm from successive matings become mixed in the spermatheca of the ♀. A ♀ with a given recessive character was mated successively with ♂♂ carrying either the dominant or recessive allelomorph of the same character. She was transferred to a different jar each day so that the progeny resulting from the eggs laid each day might be counted. After the 2nd pairing, offspring showed that only sperm of the 2nd ♂ were used in fertilizing eggs up to a certain time, when apparently most of the sperm of the 2nd ♂ were exhausted. Sperm of the 1st ♂ were again used at this time, indicating that there is no mixing of different sorts of sperm, but that those of the 2nd ♂ are apparently packed on top of those of the 1st. This is also a method of testing the effect of age of sperm on the offspring.—*K. Jeffers.*

18177. **OGURA, SABURO.** A new case of linkage in silkworms with special reference to multiple allelomorphs. *Proc. Third Pan-Pacific Sci. Congress, Tokyo* 1: 1159-1163. 1926(1928).—Silkworms commonly moult 4 times during their larval stage but certain races moult 5 and others 3 times. The number of moults is conditioned by multiple allelomorphs. T^3—3 moults. T^4—4 moults and T^5—5 moults. The factor for flesh colored cocoons, *F,* was found to be linked with the moulting factor *T* with about 11.2% of crossing over.—*G. F. Sprague.*

18178. **PATTERSON, J. T.** A mutable miniature gene in Drosophila melanogaster. *Amer. Naturalist* 65 (696): 86-88. 1931.—A single miniature ♂ was found among 3,678 offspring of virgin non-miniature ♀♀ treated with x-rays. A miniature stock from this ♂ gave considerable reversion to wild-type in the first 2, but less in later, generations. The reverted wild-type show no return to miniature, nor is there indication of reversion in somatic cells. Breeding tests show this to be allelomorphic to true miniature.—*W. P. Spencer.*

18179. **PATTERSON, J. T.** Somatic segregation produced by x-rays in Drosophila melanogaster. *Proc. Nation. Acad. Sci. [Washington]* 16(2): 109-111. 1930.—Evidence is presented showing that true somatic segregation can be induced in *Drosophila* by means of x-rays. Proof is given that under the conditions of the experiment actual segregation of the chromosomes takes place among somatic cells.—*J. T. Patterson.*

18180. **RICHTER, JOHANNES.** Züchterische Versuche über die Erblichkeit des Kropfes bei Hunden. *Zeitschr. Zücht. B. Tierzücht u. Züchtungsbiol. einschl. Tierernähr.* 21(3): 483-503. 16 fig. 1931.—By mating full brother with sister in dogs and occasionally father with daughter, an attempt has been made to bring to light the hereditary nature of goitre. The original material was 2 ♂♂ with sporadic colloidal goitre developing at birth or during the first weeks. 14 litters resulted from 2 trial series. The clinical observations of the resulting 84 F_1 and F_2 individuals, of which 71 were dissected and histologically examined, showed neither a dominant nor a recessive hereditary factor for goitre. The course and result of these biological breeding experiments on dogs do not support the opinions of many authors (Reehold, etc.) as to the hereditary nature of goitre. The decisive factor for the origin of goitre is in the environment. If hereditary factors play any part, this would probably be inheritance of disposition.—*Author's summary (transl. by J. A. Bauer).*

18181. **SAWIN, PAUL B.** Hereditary variation of the chinchilla rabbit. *Jour. Heredity* 23(1): 39-46. 5 fig. 1932.—Dark chinchilla (ch^s), light chinchilla (ch^l) and pale chinchilla (ch^l) are 3 allelomorphs of albinism in the rabbit in which yellow pigment is characteristically absent. In dark chinchilla, black pigment appears intense; is dominant to the less intense brownish black shades of light and pale chinchilla and to albinism; is unaffected by influences of temperature and fades

almost imperceptibly. The eye of this allelomorph is blue, but may be modified to gray or "pseudo-brown" by modifying genes which produce pigment in the front wall of the iris. Light and pale chinchilla are incompletely dominant to albinism; are subject to the influences of temperature, and fade with the advancing age of a hair-generation. The eye color of these allelomorphs resembles the brown of full colored rabbits, and, like it, is subject to the same iris modifying genes as is dark chinchilla, varying from light brown to intense brownish black. Brown-eyed dark chinchillas may be heterozygous for light or pale chinchilla—a combination which breeds true for neither coat nor eye color—or they may be modified blue or "pseudo-brown," in which case they are more likely to breed true. They may be due, also, to a combination of these constitutions.—*Author's abstract.*

18182. **SCHMIDT, HERBERT. Geschlechtsumwandlungen bei tropischen Zierfischen.** *Züchter* 2(10): 297-305. 8 fig. 1930.—Changes from ♀ to ♂ are described in the viviparous fishes *Xiphophorus helleri, Mollienisia velefera, Heterandria formosa,* and in *Belta splendens, Macropodus viridi-auratus,* and *Trichogaster labiosus,* and in species hybrids having *Xiphophorus helleri* as one parent. Females known to have produced young changed to ♂♂ in secondary sexual characters and proved fertile when individually mated with virgin ♀♀. Observed progeny from mating transformed animals (♀ to ♂) to normal females gave more ♀♀ than ♂♂ (in *Xiphophorus helleri* 24 ♂♂ to 31 ♀♀ and in *Macropodus viridi-auratus* 74 ♂♂ to 197 ♀♀), suggesting that the ♀ sex carries XY in these species, assuming that YY is lethal.—*B. L. Warwick.*

18183. **STERN, CURT. Konversionstheorie und Austauschtheorie.** *Biol. Zentralbl.* 50(10): 608-624. 1930.—This is a critical review of Winkler's "Konversionstheorie," which attempts to explain recombination of linked characters as due to gene mutations (Conversions), $A \rightarrow a$ or $a \rightarrow A$, which are supposed to occur when allelomorphs are in heterozygous condition. Comparisons made between Winkler's theory and the crossing-over theory indicate that both theories can account equally well for simple cases of recombinations but that complicated cases could better be explained by crossing-over theory. Conversion theory fails to account properly for cases where deficiencies and translocations are involved.—*M. Demerec.*

18184. **STERN, CURT, und K. SEKIGUTI. Analyse eines Mosaikindividuums bei Drosophila melanogaster.** *Biol. Zentralbl.* 51(4): 194-199. 1 fig. 1931.—In the progeny from a Stubble ♀ × Curly haplo-IV ♂ cross a ♂ was found which was mosaic as follows: entire head and left half of thorax had Stubble and haplo-IV bristles, left wing was normal; right half of thorax and entire abdomen was haplo-IV with non-Stubble bristles, right wing was Curly. The mosaic ♂ developed from a binucleated egg, one of whose nuclei contained the Stubble chromosome, the other was normal; this egg was fertilized by 2 non-IV-but-Y-bearing spermatozoa, one of which contained the Curly, the other the non-Curly chromosome. The ♂ was sterile.—*A. H. Hersh.*

18185. **VAN ATTA, ELVENE W. Dominant eye-colors in Drosophila.** *Amer. Naturalist* 66(702): 93-95. 1932.—Produced by x-raying.

18186. **WHITING, P. W. Diploid mosaics in Habrobracon.** *Amer. Naturalist* 66(702): 75-81. 1932.—In *Drosophila* the majority of mosaics are caused by chromosome elimination. In *Habrobracon* haploid mosaic ♂♂ develop from binucleate eggs from virgin heterozygous ♀♀, haplo-diploids (gynandromorphs) from binucleate eggs in which 1 nucleus is fertilized. 70 of the former, 78 of the latter have been found. Only 3 diploid mosaics, 2 ♀♀ and 1 biparental ♂, have been previously reported. Four new diploid mosaics, 1 ♀ and 3 ♂♂, are described. All 3 ♀♀ proved fertile; the 2 ♂♂ tested were sterile as expected for biparental ♂♂. Diploid mosaics are explained by chromosome elimination. In the new mosaic ♀, a chromosome was lost carrying 2 linked genes, dominant allelomorphs to "cantaloup," and to "long." Causes of relative frequencies of different types of mosaics and reasons for considering these as diploid are discussed. Like other mosaics, these diploids showed asymmetry in wild type traits. Two biparental ♂♂ showed correlative gene effect, modification of eye color in orange series.—*P. W. Whiting.*

18187. **WHITING, P. W., and EDWARD J. WENSTRUP. Fertile gynandromorphs in Habrobracon.** *Jour. Heredity* 23(1): 31-38. 10 fig. 1932.—Mosaic ♂♂ are found occasionally among segregating haploid ♂ offspring of heterozygous virgin females. The explanation is egg binuclearity. The two oötid nuclei with post reduction of genes undergo parthenogenetic cleavage. Gynandromorphs develop from binucleate eggs in which one nucleus is fertilized. Thus male parts are haploid and matroclinous; female parts, diploid and biparental. Reproductive instincts are determined by the head and hence most gynandromorphs are sterile, for there is lack of agreement between sex of head and of gonads. Six cases are reported with instincts, head and gonads in agreement. Two with vigorous ♂ instincts were nevertheless unable to mate. Two functioned as ♂, the progeny showing that their testes were matroclinous. Two functioned as ♀, the progeny showing that their ovaries were diploid and biparental.—*Author's abstract.*

4 fig. 1930.—In each of these 2 sets of triplets the individuals are closely similar in a number of physical characters, including friction skin patterns, and in many physiological and psychological characteristics. Cross-resemblance was observed in the friction skin patterns. Each set had a common placenta at birth.—*A. E. Clarke.*

18193. CURTIUS, F., und R. STREMPEL. Gleichzeitiges Vorkommen von Morbus Recklinghausen und Epidermolysis bullosa traumatica hereditaria dystrophica in einer Familie. *Dermatol. Zeitschr.* 51(6): 401-416. 1928.—Clinical history of a family of 6 children of whom the mother and some other maternal relatives have epidermolysis bullosa hereditaria dystrophica and the father had the brown pigment spots of Recklinghausen's disease. One son has e.b.h.d., another son has R's disease, and the 4 remaining children have the characteristics of both. In the cases of R's disease, the tumors have not developed because of the youth of the patients, or the disease is of the abortive, "forme fruste" type. While the simple form of epidermolysis bullosa frequently shows dominant inheritance through a series of generations, typical dominant inheritance of the dystrophic type through 3 generations has rarely been noted. The R's disease also shows dominant inheritance in this case. As is frequently the case in R's disease, the affected children show other abnormal characteristics such as lymphocytosis, leucopenia, and skeletal anomalies.—*M. L. Earle.*

18194. DAVENPORT, C. B. Heredity of human eye color. *Bibliogr. Genetica* [*Gravenhage*] 3: 443-460. 1927.

18195. DAVENPORT, C. B. Hearing in children when both parents have otosclerosis. *Trans. Amer. Laryngol. Rhinol. and Otol. Soc. Inc.* 7p. 1930.—An examination of 6 pedigrees in which two otosclerotics marry and have offspring. There are 19 grown children of whom 18 have otosclerosis. One more, who died at 63 years, had normal hearing. Suggestion that a simple Mendelian recessive may be responsible for otosclerosis.—*C. B. Davenport.*

18196. ELLIS, R. W. B. Four cases of Fragilitas ossium and blue sclerotics. *Proc. Roy. Soc. Med.* 24 (8): 1054-1057. 3 fig. 1931.—Case reports with family trees.

18197. ELLIS, R. W. B. Heterochromia of irides and hair. *Proc. Roy. Soc. Med.* 24(8): 1057-1058. 1931.—The subject had 1 brown and 1 green-blue iris, and a patch of black hair on 1 side of the scalp, the hair on the other side being fair. The pedigree suggests that the father and mother are heterozygous for eye color.

18198. GILLETTE, C. P. An inheritable defect of the human hand. *Jour. Heredity* 22(6): 189-190. 2 fig. 1931.—A short-fingered condition is described which is the result of a shortening of the metacarpal bone of the fourth finger, rendering this digit approximately the same length as the fifth finger. The inheritance is traced through 3 generations and is apparently due to a single dominant gene.—*L. M. Dickerson.*

18199. GOULD, HARLEY N., and BEATRICE DAVIS. Size of family in stocks supplying students to Newcomb College. *Jour. Heredity* 21(12): 489-494. 1 fig. 1930.—A statistical study based upon the families of which 250 students were members, the parents of these families, and 1535 families of the parents' sibs, reveal that the parental generation represented an increase of the stocks; but beginning with the filial generation, a decline in the stock is apparent in spite of a reduced death rate.—*L. M. Dickerson.*

18200. GREULICH, WILLIAM WALTER. The sex ratio among human stillbirths. *Science* 74(1906): 53-54. 1931.—The average numbers of ♂♂ per 100 ♀♀ among 50,810 stillbirths reported in a selected area of the United States during 1926, 1927, and 1928 were as follows: Less than 4 months gestation, 357.48; 4 months, 223.14; 5 months, 139.36; 6 months, 128.91; 7 months, 116.60; 8 months, 125.26; 9 months, 137.43; 10 months or more, 150.13. Total average, 135.83 ♂♂ per 100 ♀♀. Errors in diagnosing the sex probably account for a part of the great excess of ♂♂ in the first age group, though its true masculinity is considered to be greater than that of the next older group. The excess of ♂♂ at conception is definitely greater than at birth.—*W. W. Greulich.*

18201. GRÜNTHAL, E. Klinisch-genealogischer Nachweis von Erblichkeit bei Pickscher Krankheit. *Zeitschr. Ges. Neurol. u. Psych.* 136(3/4): 464-482. 1931.—The author reports 3 cases of Pick's atrophy of the frontal lobe in 2 sisters (4th generation) and the son of the younger, beginning about the 40th year in each. The family (6 generation tree given) had a number of psychopathic and subnormal members.

18202. HENNINGER, HERBERT. Zur Kasuistik der Exostosis Cartilaginea multiplex hereditaria. *Deutsche Zeitschr. Chir.* 232(8/10): 666-673. 4 fig. 1931.—The author describes 4 patients whose family showed hereditary multiple cartilaginous exostoses in 7 of 13 members in 3 generations. He attributes the trouble to a faulty anlage of the chondro-osteogenic tissue, not to endocrine dysfunctions.

18203. HUSKINS, LEONARD C. On the inheritance of an anomaly of human dentition. *Jour. Heredity* 21 (6): 279-282. 1 fig. 1930.—The anomaly described fluctuates in its degree of expression and of recessiveness. In its extreme form it is the absence of the 2 center incisors of both jaws from both sets of teeth. Its transmission agrees with that of an X-chromosome factor.—*L. C. Huskins.*

18204. JAKOBOWICZ, MELA. Über eine Exostotikerfamilie. *Zeitschr. Konstitutionsl.* 13(6): 699-703. 1928. —A typical case of hereditary deforming chondrodysplasia, with a characteristic family tree.—7 affected out of a total of 11 in 3 generations. The affection is an anomaly of the germ-plasm. "Some progenitor implanted this developmental deformity as an autogenous plasm variation, and it became fixed by transmission."—*A. Ehrenfried.*

18205. JENKINS, R. L. Twin and triplet birth ratios, a further study of the interrelations of frequencies of plural births. *Jour. Heredity* 20(10): 485-494. 6 fig. 1929.—With a given proportion of dizygotic twins (a) and of monozygotic twins (b) in a population, the proportion of the 3 types of triplets (trizygotic, dizygotic and monozygotic) should be as $a^2:2ab:b^2$ on the theory that the 2 kinds of twinning are unrelated phenomena. The data do not confirm this although the total proportion of triplets is approximately the square of that of total twins, as expected. If, however, both dizygotic and monozygotic twinning may (in part) trace to a common factor, viz., a tendency of the egg to double production whether before reduction or after fertilization, the data can be explained. Corrections are made for the differential distribution of twins and triplets according to age of mothers.—*S. Wright.*

18206. KLEIN, EDM. J. Der Wert des Mittelgutes. Eine Betrachtung über Genetik und Volkstum. *Arch. Trimestr. Inst. Grand-Ducal Luxembourg Sec. Sci. Nat. Phys. & Math.* 11: 53-63. 1929.—A popular lecture on the value of the people in the central quartiles (Mittelgut) of a population of farmers. While continuous selection occurs as the more intelligent and the less efficient physically go to the cities, the farm population will never cease to produce these types because of its complex heterogeneous constitution.—*O. W. Richards.*

18207. KOMAI, TAKU, and GORO FUKUOKA. A set of dichorionic identical triplets. *Jour. Heredity* 22(8): 232-243. 7 fig. 1931.—A set of Japanese girl triplets 11 years old, examined physically and psychologically, show such close similarity to one another that they are almost certainly monozygotic. The afterbirth, which has been preserved, however testifies clearly that they are dichorionic.—*Author's abstract.*

18208. KRANZ, HEINRICH. Zur Frage des erblichen Zusammentreffens von Exostosen und Rachitis. *Arch. Rass- u. Ges. Biol.* 25(3): 292-294. 1931.—Pedigrees of 2 families in which rickets and exostoses appeared in varying degrees with great frequency. The most severe

rickets accompanied the most pronounced exostoses.—*P. Popenoe.*

18209. **LAMBERT, ROBERT K., and CLYDE E. McDANNALD.** Hereditary high hyperopia. *Amer. Jour. Ophthalmol.* 14(1): 46-48. 1 fig. 1931.—The authors report 5 cases (Italians, mother and 4 of 7 children) of high hyperopia complicated by convergent strabismus, in 3 by nystagmus and in 4 by optic pseudoneuritis as well; nothing warranted the presumption of microphthalmos. No history of abnormality appeared in the history for 4 generations on either side, nor were the parents related.

18210. **LEVIT, S. G., and N. N. MALKOVA. A new mutation in man, hemophilia-a.** *Jour. Heredity* 21(2): 73-77. 1 fig. 1930.—Seven generations of a family involving 72 individuals were studied. The name hemophilia-*a* (autosomal) is proposed tentatively. The defect apparently is a dominant, autosomal gene mutation, apparently operative through some defect in the capillary walls. Coagulative properties of the blood are always normal. Violent hemorrhages are caused by rupture of tissues and take place spontaneously through mucous membranes.—*L. M. Dickerson.*

18211. **MACKLIN, M. T. The relation of the mode of inheritance to the severity of an inherited disease.** *Human Biol.* 4(1): 69-79. 1932.—Inherited diseases may not be uniform in their mode of inheritance in different families. Severe types of the disease, especially those occurring at an early age, are usually recessive in their transmission. If severe, and dominant in inheritance, the age of onset is past adult life. The mild forms of the disease tend to exhibit the dominant rather than the recessive mode of inheritance, and occur at a later period of life. Age of onset, extent and severity of disease appear to be heritable factors, and tend to be alike for siblings, although differing from the same factors in other families. —*M. T. Macklin.*

18212. **MAXWELL, ALINE, and R. R. HUESTIS. Student test-score rank and family size.** *Jour. Heredity* 21(5): 211-215. 1930.—Information as to family size supplied by 707 university students was checked by their parents and arranged in occupational groups. The average number of children per family was $3.31 \pm .05$, and only one group, farmers and foresters, deviated materially from this average. Small negative coefficients of correlation between student test score rank and family size were found in two individual groups and in the whole population. Differences between the birth rates of different occupations and between the average mental test ability of families of different size were smaller than those usually reported by eugenic investigators.—*A. Maxwell and R. R. Huestis.*

18213. **MERRITT-HAWKES, O. A. The Leunbach family, a Danish family with American Indian blood.** *Jour. Heredity* 20(10): 469-479. 5 fig. 1929.—The inheritance of several physical characters is traced through 5 generations from an Indian × White cross. Many of the Indian characteristics appear to be dominant and persist even in the 5th generation.—*L. M. Dickerson.*

18214. **MIROLLI, ANGELO. La elefantiasi familiare delle gengive. [Familial elephantiasis of the gums.]** *Arch. Ital. Chir.* 29(4): 401-416. 7 fig. 1931.—The family tree of the patient shows all 4 generations and 12 of the 29 members more or less affected with chronic hypertrophic gingivitis.

18215. **NEWMAN, H. H. Differences between conjoined twins in relation to a general theory of twinning.** *Jour. Heredity* 22(7): 200-215. 9 fig. 1931.—A study of several sets of Siamese twins shows that the components are distinctly less similar in head size, facial characters, palm and sole patterns, etc., than are separate identical twins. If conjoined twins are the product of a relatively late fission of the blastoderm after the 2 halves of the embryo have been irreversibly differentiated in right and left directions, the more extensive asymmetry reversal, mirror-imaging, in conjoined as compared with separate monozygotic twins, as well as their greater differences in all sorts of bodily characters, are accounted for. A special study of the palm and sole patterns of conjoined twins helps to confirm the above theory.—*H. H. Newman.*

18216. **NEWMAN, H. H. Mental and physical traits of identical twins reared apart. Case IV.** *Jour. Heredity* 23(1): 3-18. 7 fig. 1932.—This 4th case in the present series differs from all previous cases in that the twins differ equally strongly, physically, mentally and temperamentally. Previous cases have exhibited very close correspondence in at least one of these respects. In pair IV, one girl was reared on a prosperous farm, the other in a small town, where she lived mainly a sedentary life. The town girl had gone through high school and had studied music extensively; the farm girl had finished the 8th grade in country school. The farm girl was very superior physically and somewhat more normal temperamentally, but much inferior in I. Q. and mental age. A brief summary of the first 4 cases is given. The most striking feature of the study so far is that the average differences in I. Q. and mental age of the 4 cases of identical twins reared apart is somewhat greater than the average of fifty pairs of fraternal twins reared together. The bearing of this on the heredity-environment controversy is discussed.—*Author's abstract.*

18217. **OREL, HERBERT. Die Vererbung der Ichthyosis congenita und der Ichthyosis vulgaris.** *Zeitschr. Kinderheilk.* 47(3/4): 312-340. 2 fig. 1929.—Following discussion of the differentiation between the types of common ichthyosis and the 3 types (Riecke) of the more severe congenital ichthyosis, the author analyzes the mode of inheritance in many reported cases of both forms of the disease, illustrating the discussion with a series of family charts. While there are cases on record which may be considered transitional, the 2 forms of the disease are genotypically unlike and are distinct anomalies. The author describes an ichthyotic family in which the mode of inheritance is doubtful, and discusses the family histories of 7 cases which he has worked out with exactness. Owing to wide variations in manifestation and to the small number of generations reported, the mode of inheritance of common ichthyosis has not been definitely determined. In the majority of cases it shows the dominant, often the irregular dominant, type of heredity; and there is also a sex-linked recessive type. It is even possible that it may sometimes be transmitted as a simple recessive. Consanguinity of the parents in cases of common ichthyosis is not more frequent than in the general average of the population. Inheritance of congenital ichthyosis is recessive in type, with frequent consanguinity of the parents and occurrence of the disease in more than 1 child in a family. All cases should be carefully classified with reference to family history and type of inheritance. —*M. L. Earle.*

18218. **PALMA, MODESTO DALLA. Sulla eosinofilia famigliare. [Familial eosinophilia.]** *Policlinico (Sez. Med.)* 38(12): 605-619. 1 pl. 1931.—In a family of 65 members for 3 generations there were 33 cases of eosinophilia (13 members of the family not examined).

18219. **PERLEY, ARTHUR E. Two cases of brachydactylia.** *Radiology* 17(5): 1056-1058. 3 fig. 1931.—In one instance, the short distal phalanges on the thumbs had been hereditary on the paternal side for several generations; in the other, bilateral brachydactylia in the 5th metacarpals was present in the patient, mother, and great grandmother.

18220. **PITTARD, EUGÈNE. La répartition du cancer dans les Iles Britanniques. Rapports possibles entre le cancer et la race.** *Bull. et Mém. Soc. Anthrop. Paris* 10: 74-76. 1929.

18221. **POPENOE, PAUL. The inheritance of artistic talents.** *Jour. Heredity* 20(9): 415-423. 1929.—Historical data and the results of intelligence tests are cited to show: that exceptional intelligence develops early, especially ability in musical expression and composition; that art runs in families; and exceptional ability as a performer is not so closely correlated with general intelligence as is creative ability.—*L. M. Dickerson.*

18222. POPENOE, PAUL. Feeblemindedness today. *Jour. Heredity* 21(10): 421-431. 2 fig. 1930.—A critical review of several recent publications. In a few instances, specific survey data are cited in evaluating certain quoted statements. The problem of the feebleminded is crystallized in 5 questions. The answering of these questions, with adequate evidence, must be regarded as the minimum basis upon which an eugenic solution of the problem can be based.—*L. M. Dickerson.*

18223. POPENOE, PAUL. Anthropology and eugenics. *Jour. Heredity* 22(9): 277-280. 1931.—A critical review of value to anyone interested in a bibliography of recent German publications in these allied fields; covers 17 titles.—*L. M. Dickerson.*

18224. POPENOE, PAUL, and KATE BROUSSEAU. Huntington's chorea. *Jour. Heredity* 21(3): 113-118. 1 fig. 1930.—A pedigree covering parts of 4 generations agrees with earlier studies that Huntington's chorea behaves as a simple Mendelian dominant. The organic basis and eugenic aspects of the affection are discussed. —*P. Popenoe.*

18225. RIFE, DAVID C., and L. H. SNYDER. Studies in human inheritance VI. A genetic refutation of the principles of "behavioristic" psychology. *Human Biol.* 3(4): 547-559. 1931.—A study of the families of those inmates of institutions for the feeble-minded who possess some marked special ability, in drawing, music, etc., showed that the special ability usually appeared in the patient's family, as did the feeble-mindedness, though not in the same individuals. In the patients under discussion, both traits were inherited coincidentally, the special ability manifesting itself because of the genetic make-up of the individual and in spite of the absence of normal intelligence or of training. This would seem to be a specific refutation of the principles of "behavioristic" psychology.—*L. H. Snyder.*

18226. ROLLINS, WELD A. The fertility of college graduates. *Jour. Heredity* 20(9): 425-427. 1 fig. 1929.—The average number of children born to men who graduated from college between 1658 and 1880 was invariably about ⅓ less than the average number of children born to wives in the general community. The % of childless marriages was more than twice as great in the college group during 1826-1880. An inference drawn is that the differential will not be self correcting, and that the process, taken in connection with immigration, will gradually change the physical inheritance and the family and group tradition of the nation.—*W. A. Rollins.*

18227. ROLLINS, WELD A. The fertility of college graduates II. A comparison of the average number of children born to college graduates with the average number of children born to their brothers and male cousins. *Jour. Heredity* 20(11): 535-539. 1 fig. 1929.—An examination of 6 New England genealogies disclosed that 160 college graduates averaged 2.61 children born per man; 146 brothers, 3.11; and 331 cousins, who like the brothers were not college graduates, 3.33. The period covered was 1790 to 1870, those born within that time being taken. The fertility of all 3 groups lessened during the period, but that of the cousins decreased least, and that of the brothers most. Throughout the period, the cousins on the average always married first, brothers next, graduates last.—*W. A. Rollins.*

18228. ROLLINS, WELD A. The effect of immigration on the birth rate of the natives. *Jour. Heredity* 21(9): 387-401. 5 fig. 1930.—Statistical studies comparing "college graduate" and "colonial stock" groups with the trend of immigration show that as immigration into the U. S. A. has increased, the birth rate of the native groups has decreased, the "college graduate" group showing the most marked decline.—*L. M. Dickerson.*

18229. ROSSMAN, JOSEPH. Heredity and invention. *Jour. Heredity* 21(12): 507-512. 1930.—A statistical study based on questionnaire data from over 700 inventors. The transmission of inventive ability involves numerous factors. Economic and geographic conditions and social ideals, rather than hereditary abilities, may be the chief causes for the decided differences in geographic distribution of inventiveness.—*L. M. Dickerson.*

18230. RUDIN, E. Praktische Ergebnisse der psychiatrischen Erblichkeitsforschung. *Naturwissenschaften* 18 (13): 273-280. 1930.—Discussion of the difficulties of investigation and of the possibilities of practical application of the conclusions reached.

18231. SCHMIDT-BÄUMLER, HEINRICH. Familiäres Cylindrom. Ein Beitrag zur Frage der geschlechtsbegrenzten Vererbung. *Arch. Dermatol. u. Syph.* 163(1): 114-125. 5 fig. 1931.—In one family of 20 living members, 6 women had multiple symmetric nodules, 1 boy a single large node. In 3 (boy and 2 sisters) there were cylindromata; clinical similarity indicates that the other tumors in this family are the same. The familial grouping was hereditary, and dominant sex-linked descent seemed probable, indicating close relationship with the clinically similar epithelioma Brooke.—*Author's summary (transl.).*

18232. SCHREIBER, G. Finger-prints in monozygotic twins. *Jour. Heredity* 21(9): 403-406. 2 fig. 1930.—The finger prints of a pair of twins, their 3 brothers and the parents, are compared as to type. Reversed symmetry is found between the twins, emphasized by a congenital abnormality of the thumbs. The resemblances between the twins are greater than between the other individuals and parallelled by greater anatomical resemblances.—*L. M. Dickerson.*

18233. SCHULTZ, A. H. The hereditary tendency to eliminate the upper lateral incisors. *Human Biol.* 4(1): 34-40. 1932.—Marked reductions in the size of the upper lateral incisors, including the complete congenital lack of these teeth, are fairly common in the higher races of man. Such variations in size, leading toward the elimination of these incisors, are of a hereditary nature. It is not a particular variation, however, but the tendency to vary in the direction of a reduction, which is inherited. By various pedigrees it is shown that this tendency is not genetically alike in all cases, but can be inherited in quite different manners in different families.—*A. H. Schultz.*

18234. SIEMENS, HERMANN WERNER. Das Problem der Erbgleichheit bei den eineiigen Zwillingen. *Virchow's Arch. Path. Anat. u. Physiol.* 264(2): 323-346. 14 fig. 1927.—Reasons for the author's belief in the hereditary similarity of single-egg twins are given. The arguments of Levens, Mathes, and Newman concerning hereditary differences are reviewed.—*E. E. Jones.*

18235. THOMSEN, OLUF, und JOHS. CLAUSEN. Das Vorkommen von Landsteiners "Immunreceptoren" M und N in der Dänischen Bevölkerung. *Hereditas* 15 (2): 213-218. 1931.—Landsteiner and Levine have demonstrated the existence of 3 till then unknown erythrocyte receptors, M, N, and P. For these receptors, agglutinin is not found in the serum of man. The receptors can be demonstrated only by the help of absolutely pure immune sera. An examination was made of 442 healthy subjects and 135 patients suffering from different diseases. The total material contained 74.6% M, 70.1% N, and 44.6% MN. The grouping by M and N was independent of the groups of the main system O, A, B, and AB. No case was found in which both M and N were lacking. Data on the offspring from various parent combinations of M, N and MN agree with the view of Landsteiner and Levine that M and N are allelomorphic factors. The combination of the two systems of grouping gives extended possibilities for use in paternity cases. —*H. Wexelsen.*

18236. WAGONER, GEORGE, and BERNARD N. E. COHN. Osteochondritis dissecans. A résumé of the theories of etiology and the consideration of heredity as an etiologic factor. *Arch. Surg.* 23(1): 1-25. 7 fig. 1931.—Osteochondritis dissecans occurred in 3 men of one family, son, father, and paternal uncle, and in 2 brothers, bilaterally in one.

18237. WELLISCH, S. Die Massenerscheinung der Blutgruppen. *Zeitschr. Rassenphysiol.* 4(1): 27-31. 1931. —The author considers, from a mathematical viewpoint,

how large a population should be studied in order to yield representative results.—*P. Levine.*

18238. **WELLISCH, S. Über die Genauigkeit der Kinderverteilung bei Ehen mit bekannter Aufspaltung.** *Zeitschr. Rassenphysiol.* 4(1): 32-36. 1931.—The author studied the incidence of the children in groups A and B, coming from matings O × AB. In his material, compiled from numerous papers, the deviation from the theory, as calculated by a formula derived by the author, is but 1/18 as large as the standard deviation. This result is to be expected from the Bernstein theory. Wellisch attempted to apply the same method to the study of the union O × A. The results from a statistical viewpoint were not satisfactory when he included only families with at least one child of group O and one child of group A. On omitting from the data the material of some investigators, there was close approximation to the expected values. Satisfactory results were obtained in an analysis of all matings O × A, A × O, O × B, B × O, with at least one child of group O and one of group A or B, and also in the matings O × A when no families whatever were omitted.—*P. Levine.*

18239. **WILLOUGHBY, RAYMOND R. Cross-cousin marriages and population stabilization.** *Pedagogical Seminary and Jour. Genetic Psychol.* 35(1): 129-131. 1928.—Using his method of hypothetical populations of individuals of known genetic constitution, "bred" by dice throws to simulate the chance contacts of gametes, the author examined the operation of the cross-cousin marriage system (occasionally met in primitive groups) with reference to its tendency to render the population homozygous. Five factors were assumed, of which one was already stabilized at the beginning of the experiment; the remaining 4 were rendered homozygous in 40 generations, during which the average value for the population described a rough sine curve and reached stability at a level somewhat higher than the initial one.—*R. R. Willoughby.*

18240. **WILLOUGHBY, RAYMOND R. A method for approximating genetic constitutions.** *Pedagogical Seminary and Jour. Genetic Psychol.* 35(1): 131-134. 1928. —A hypothetical system of multiple cumulative factors, compiled as realistically as possible, is assumed. In a real family in which quantitative measures of the trait under consideration are available for each individual, constitutions from the hypothetical system tallying in total value with the observed measures are tentatively assigned each parent. All possible constitutions for offspring of the hypothetical parents are then compared as to their total value with the observed values for the real children of the real parents, and (1) if possible, appropriate constitutions are assigned to these children and the process continued to their mates and children, or (2) the absence of any appropriate values among the possible constitutions necessitates selection of another possibility for either or both parents, whereupon the process is repeated until a set of constitutions consistent with the facts is derived.—*R. R. Willoughby.*

18241. **WILLOUGHBY, RAYMOND R. What is a genetic stock?** *Pedagogical Seminary and Jour. Genetic Psychol.* 35(4): 619-623. 1928.—After a consideration of the difficulties inherent in assigning satisfactory meaning to the term, the definition is suggested that the stock of a given individual comprises those individuals having (on a probability basis) at least one somatic chromosome in common with him. A list and a diagram are given of the degrees of relationship which would be included in a normal stock under this definition; and possible advantages from the use of the concept are suggested.—*R. R. Willoughby.*

18242. **WILLOUGHBY, RAYMOND R. Longevity in a human stock.** *Pedagogical Seminary and Jour. Genetic Psychol.* 35(4): 624-626. 1928.—To illustrate the author's concept of stock, the longevity of a related group is studied level by level, and the results stated in terms of the weighted average of these.—*R. R. Willoughby.*

18243. **WILLOUGHBY, RAYMOND R. The fecundity of the name-males over ten generations of a descendant human pedigree.** *Pedagogical Seminary and Jour. Genetic Psychol.* 36(1): 178-182. 1929.—The average fertility per ♂ is almost constant or possibly shows a slight rise from generations III to VI (covering approximately the 18th century, in America), but breaks sharply to generation IX (about 1870); between highest and lowest generations, the difference between averages is about 4 children. The variability also decreases markedly after generation V.—*R. R. Willoughby.*

18244. **WILLOUGHBY, RAYMOND R. The dying professor. A study in faculty family size.** *Jour. Heredity* 21(6): 273. 1930.—A statistical study of the size of faculty families in a small New England university. A per member maximum of 1.65 or 1.70 child is estimated for the group.—*L. M. Dickerson.*

18245. **WILSON, PAUL T. A study of like-sexed twins. III. Twinning among relatives.** *Jour. Heredity* 21(8): 371-374. 1930.—Among the relatives of 198 pairs of like-sexed twins, 300 cases of twinning were located (about equally divided among the relatives of the identical and the fraternal pairs, and about equal on maternal and paternal sides). In the case of the parents and grandparents, it was possible to determine the %-incidence of twins; this was not reliably different from the % in the general population. This may be attributable to a low fecundity of twins rather than to the absence of an heritable tendency.—*P. T. Wilson.*

18246. **YUAN, I-CHIN. The influence of heredity upon the duration of life in man based on a Chinese genealogy from 1365 to 1914.** *Human Biol.* 4(1): 41-68. 1932.—A statistical study of 20 generations of a Chinese family, analyzing the age at death of sons according to the duration of life of their parents. Parents were divided into three groups according as their age at death was 20-49 years, 50-69, 70 and over. It was found by a study of the survivorship curves of their sons and their average duration of life that there was a progression in the length of life of sons in the same order as that of their parents. The same progression was found, but less marked, according as either parent was considered without regard to the other, or when the life duration of both parents occurred in the different combinations possible with these three age groups.—*M. Merrell.*

18249. AIKMAN, J. M. The effect of physical factors on the development of woodland and prairie associations in Iowa. *Proc. Iowa Acad. Sci.* 37: 209. 1930(1931). —Abstract.

18250. ATKINS, W. R. G., and H. H. POOLE. Photo-electric measurements of illumination in relation to plant distribution. 4. Changes in the colour composition of daylight in the open and in shaded situations. *Sci. Proc. Roy. Dublin Soc.* 20(1/7): 13-48. 6 fig. 1931.—A portable outfit for the photo-electric measurement of light color in the open and in woodlands is described. Measurements were made by the use of portable micro-ammeters in positions with good illumination, but in the more shaded situations it was necessary to use a very sensitive neon lamp device (described by J. H. J. Poole), combined with a (General Electric) thin film caesium vacuum cell, type CMV6. The infra red sensitivity of the cell was suppressed by a heat absorbing filter, so that a wave-length sensitivity curve approximately horizontal was obtained. A color factor method is described whereby the color of the light may be measured in terms of daylight from a grey sky or any other chosen source. Light in woods was very poor in blue, relatively rich in green, close to sunlight in content of orange red, and very much richer than either skylight, daylight, or sunlight in the deep red, probably due to the great transparency of chlorophyll for the deep red. Visual observations made with a spectroscope of the light in shaded positions showed a maximum in the green. Measurements are recorded of the sensitivity of direct sunlight and diffused skylight for the different portions of the spectrum. Values of the daylight factor in shaded sites have heretofore been given for blue light only; to obtain the value for any other color, that for blue must be multiplied by the appropriate color factor.—*W. R. G. Atkins.*

Méditerranéenne et Alpine* 9. 1931.—For the first time the plant communities of the Bas-Languedoc region, France, are enumerated and classified on the principle of sociological progression, which also brings out clearly their genetic relationship.—*F. R. Bharucha.*

18252. BROCKMANN-JEROSCH, H. Die Vegetation der Schweiz. Beiträge zur geobotanischen Landesaufnahme. 12. Publ. by the "Pflanzengeogr. Komm. Schweiz. Naturforsch. Ges." Lief. 1. p. 1-160, 1925; Lief. 2. p. 161-288. 1927; Lief. 3. p. 289-384, 1928; Lief. 4. p. 385-499. 1929. 8 pl. 7 charts, 3 col. maps. Verlag Hans Huber, Bern. Price, 9 Fr. each Lief.—Soil and climatic factors are examined successively, in their effects on vegetation. The pedological doctrines of Wiegner and Richard Lang (i.e., fully matured soils are all alike, regardless of type of parent rock and that they are determined wholly by climate) are subscribed to. There are, however, many apparent exceptions to this rule in Swiss soils because of their relative immaturity (moraines, talus, etc.), and because of factors retarding development (permanently frozen soils). On the conifer-forested heights the soils are bleached (podsols); above, on the peaks, permanently frozen soils. Swamps produce raw humus; locally sheltered spots, beneath overhangs, crusted soils. "Aclimatic" soils are formed through influence of plants and man (culture, domestic animals, tourist activities). Annual precipitation varies from less than 60 cm. to over 300 (locally, as at the Mönchsjoch, to 400). The

mean annual rainfall for all Switzerland is 156.27 cm. Maxima occur in different parts of the country in all mo. from June to Dec. Run off amounts to 72.7% of precipitation in the Jura; to 59.8% in the "Mittelland"; and 42.4-82.2% in the Alps. The mean for north central Europe is 28%. Evaporation losses are, of course, the complements of the run offs. The proportion of snowfall in total precipitation varies from about 10% in the Mittelland to 30% at 1000 m., 60% at 2000 m., and 100% at 3500 m. Snow harms vegetation by (1) loading, bending, and breaking trees; (2) slowly creeping in masses, bending over and decorticating shrubs and trees, uprooting smaller plants, and sometimes plowing away the soil itself; and (3) forming avalanches. The latter often follow the same paths year after year, preventing the development of more than the initial stages in succession. Snow lying on the ground prevents as great temp. fluctuations as would otherwise take place. Seed germinate, and perennial plants grow and even blossom under snow, through which a litle light penetrates. Thaw-water on frozen ground under snow usually runs off; on unfrozen ground it sinks in, causing leaching which ends in podsolization. Effects of hoarfrost and dew are minor. Hail is frequent and often highly destructive; hail maxima occur in July. Lightning apparently selects tree sp.: for 1 beech damaged there are 6 firs, 37 pines, and 60 oaks. Temp. varies greatly. The many lakes exert a modifying influence on temp. extremes in the valleys which they dominate. Descending warm winds (Föhn) result from warming of high-pressure areas at greater elevations. Plants on lee sides of mountains, protected from winds and often banked under snow, grow taller and straighter, and at greater elevations, than corresponding sp. on windward sides. At alpine and subalpine elevations plants must be prepared to face frost and snow in any mo.; hence must be able to produce new growth-points if these are frozen, or to endure low temp. with existing growth-points and flowers. Some sp. survive and flower below 40° C. Some sp. can carry on photosynthesis at as low as 16°; lichens can function at 20°. High temp. extremes express themselves in sun-scald damage to tree trunks, occasional severe droughts, and in endurances demanded of rock vegetation, on surfaces that reach as high as 52° C. Winds from the west and southwest are prevalent; from the north-to-east quarter there are winds during only 17% of the time. The number of periods of calm are related inversely to altitude. Winds influence vegetation mostly through other factors: precipitation, evaporation, etc.; but they also have striking effects in producing "Krummholz" and other forms of wind-shaped trees, as well as polster-plants and other alpine vegetation.—*F. Thone.*

18253. CAIN, STANLEY A., RAY C. FRIESNER, and JOHN E. POTZGER. A comparison of strip and quadrat analyses of the woody plants on a central Indiana river bluff. *Butler Univ. Bot. Studies* 1 (paper 10): 157-171. 1930.—This paper, which takes up the question of distribution of woody plants on hills along White River in Morgan Co., Indiana, deals especially with a comparison of the accuracy of strip transect and quadrat method in ascertaining the relative abundance and frequency of distribution of woody plants, and the transition from one sp. to another from the bottom to the top of the bluffs.—*J. E. Potzger.*

18254. CAIN, STANLEY A., and RAY C. FRIESNER. Certain aspects of the H-ion concentration of the soils of a central Indiana river bluff. *Butler Univ. Bot. Studies* 1 (paper 11): 172-175. 1930.—Samples were taken of surface and subsoil at 25 ft. intervals from the bank of a river over a 250-ft. ridge to ascertain whether or not acidity of soil would increase with altitude. While the slopes were more acid than the flood plain no direct correlation between altitude and acidity was shown. In 90% of the samples the subsoil was more acid than the surface soil by an average of approximately 0.8 of a pH. For all samples the average reaction of the surface soil was pH 5.9 and for subsoil 5.1.—*J. E. Potzger.*

18255. CAMBAGE, R. H. The origin and development of portion of the Australian flora. *Rept. Australasian Assoc. Advanc. Sci.* 19: 1-29. 1928 (1929).—There appear to be more genera common to Africa and the eastern half of Australia only, than to Africa and the western half of Australia only, so that evidence of a direct land connection between these 2 countries in late geological time is meagre. Many genera which are common to Africa and Australia have reached these countries from the same source in the north, and have then developed in response to environment. From available evidence it would seem that, at least since Cretaceous time, the northern hemisphere has had a greater land mass than the southern, and, as a result, there has been more room for plant-development in the north. Probably the Pleistocene and even earlier cold periods have been instrumental in permitting many genera to pulsate across the tropics from temperate northern regions, and in the process, and after arrival in the south, there has been much radiation, development, and evolution. Although there probably has been more migration to Australia from the north, there is evidence in some cases of secondary radiation from the south, especially in *Eucalyptus*. It seems undoubted that some genera common to Australia and New Zealand have reached both countries from the north, some sp. coming down the east coast of Australia, while others have gone by way of New Caledonia and adjoining islands to New Zealand. There appears to be more evidence in favour of a former land connection between Antarctica and So. America, and perhaps also between Antarctica, New Zealand, and Australia, than between Antarctica and Africa. Except for a land connection between Northeastern Australia and islands to the north, perhaps as late as the Pliocene or Pleistocene, Australia has long been isolated from the rest of the world. It is likely that the following large genera, among others, have originated in Australia, and developed there chiefly: *Eucalyptus, Melaleuca,* Phyllodineous *Acacia, Pultenaea, Daviesia, Grevillea, Persoonia, Hakea, Banksia, Dryandra, Goodenia, Candollea, Boronia.* These genera are represented by upwards of 1800 spp. and are almost wholly Australian. Studies of the many changes which have taken place in the history of the world's flora, of its adaptability to environment, its response to changes of climate and soil, its ability to overcome many adverse conditions, all combine to show that creation not only embodied the initial giving of life, but also provided inherent power and initiative for the necessary development and evolution required for the persistence of that life, in harmony with its varying surroundings and dominating influences.—*Author's summary.*

18256. CHESTERS, CHAS. G. C. On the peat deposits of Moine Mhor. *Jour. Ecol.* 19 (1): 46-59. 8 fig. 1931.—The peat over the 50 ft. raised beach which surrounds the head of Loch Crinan, in Argyllshire, Scotland, and that of the neighboring moorland was found to contain no remains of salt marsh vegetation. Many fragments of moorland plants were identified and pollens of *Betula* and *Alnus* were relatively abundant, while *Pinus* pollen had a low frequency. Everything suggests that the peat is of recent origin, the earliest layers dating back to sub-atlantic times.—*G. D. Fuller.*

18258. CRAW, J. R. Hydrogen-ion reaction of native Indiana fern soils. *Proc. Indiana Acad. Sci.* 39: 111-113. 1929 (1930).—The pH range of the soil in the natural habitats of 27 common ferns showed considerable variation. *Osmunda cinnamomea, Pteris aquilina, Aspidium cristatum,* and a few others, seemed restricted to soil of pH 4.3-4.7; *Aspidium goldianum* occupied soil of 7.0-7.3. The others ranged between these extremes.

18259. DÄNIKER, A. U. Neu-Caledonien, Land und Vegetation. *Vierteljahrsschr. Naturforsch. Ges. Zürich* 74 (1/2): 170-197. 4 fig. 1929.—This large sub-tropical mountainous island of the So. Pacific ocean, rising to over 1600 m., is described geologically and physically. Its mesophile relatively hygrophile forest is described in 9 associations with characteristic spp.—*J. P. Young.*

18260. FIRBAS, F. Pflanzensoziologie. *Natur und Museum* 62(2): 33-42. 5 fig. 1932.—A general statement of the scope and principles of plant sociology.

18261. GOULD, CHAS. N. Petroleum and surface vegetation. *Proc. Oklahoma Acad. Sci.* 10: 110-114. 1930. —A common belief exists among laymen, that surface vegetation often indicates mineral and oil conditions below ground. These beliefs are for the most part not supported by facts since any correlation between the geology and surface vegetation is only coincidental.—*F. P. Sipe.*

18262. HAGERUP, O. Étude des types biologiques de Raunkiaer dans la flore autour de Tombouctou. *Kgl. Danske Videnskab. Selskab. Biol. Meddel.* 9(4): 5-116. 5 pl. 1930.—In Timbucto the vegetation is dependent on summer rainfall which lasts from June until Aug. The seed of all spp. germinate in July at the height of the rainy season. The young plants grow in such numbers and with such rapidity that in a few days the barren sand is clothed with green. In some spp., seed is formed 8-10 days after the mother plant has germinated. By Aug. 1, when there are intervals of a week between rains, the vegetation begins to die, and by the last of Aug. the ephemeral vegetation is dead. Some trees, shrubs, semi-shrubby plants, and a few herbaceous plants survive until the next rainy season especially in the more favored places. During the winter, the drought is as intense as in the Sahara and the humidity of the air is reduced to a minimum. The temp. of the air and the upper layers of the soil is extreme. Many of the spp. which survive this period have a long primary root which extends down to the layers of soil which are relatively cool and moist. Many have bladders filled with water or sticky glandular hairs; or are tomentose, leathery, or reduced in size. Even the best protected spp. are subjected to great loss of water. The biological spectrum of Raunkiaer for Timbucto shows a higher % of chamaephytes and therophytes than the normal. Tall trees are lacking. Small trees and shrubs and hemicryptophytes are fewer than normal. Semi-shrubby chamaephytes are particularly well adapted to this region, since the body of the plant is lifted above the extreme heat of the surface of the soil and is yet not high enough to be subjected to the desiccating effect of strong winds. Semi-shrubby chamaephytes make up 36% of the flora, in contrast to the Sahara where therophytes predominate. The flora of Timbucto is most closely related to that of regions east and south since seed are scattered by the winds, which come from these directions. The Sahara is a barrier to plants from the north. All spp. seed plants found near here are described.—*B. Ennis.*

18263. HEIL, HANS. Altrheinvegetation. *Vegetationsbilder* 20(2): Pl. 7-12. 1929.—A number of aquatic plant communities are illustrated and briefly described. Among the spp. depicted are *Nuphar luteum, Trapa natans, Ranunculus divaricatus, Limnanthemum nymphaeoides, Polygonum amphibium, Nymphaea alba,* and *Ceratophyllum demersum.*—*G. D. Fuller.*

18264. JENNINGS, O. E. Further notes on the plant geography of western Pennsylvania. *Proc. Pennsylvania Acad. Sci.* 3: 42. 1929.—Abstract.

18265. KOCH, HANNS. Paläobotanische Untersuchungen einiger Moore des Münsterlandes. *Beih. Bot. Centralbl. Abt. 2.* 46(1): 1-70. Map, 8 fig. 1929.—The bogs of western and northern Münsterland are mostly raised, and their development to the present stage has been conditioned by the large deposits of material received on account of the geographical location. Their origin was mostly due to the sand-clay substratum becoming swampy. Their raised bog character is recognizable by the peat strata (represented by the Sphagnetum and lenses of Eriophoro-Callunetum); and where difficulties are encountered in this they can be recognized by the surface configuration and the recent vegetation. Pollen analysis indicates that the bogs originated at different periods, some being even preboreal. The stratigraphy gave no indication of a change of climate in post-glacial time. A subatlantic dry stage in the sense of Gams and Nordhagen was identified. The comparison of the pollen spectrum of these bogs with that of other mid-European bogs indicates clearly the forest succession: (1) birch stage—decreasing % of *Salix*, increase of pine, and entrance of hazel (Preboreal); (2) pine stage—rational boundary of hazel pollen, decrease of the birch curve, entrance of alder (Preboreal); (3) pine-hazel stage—common entrance of *Ulmus, Tilia,* and *Quercus,* culmination of pine and hazel, spread of the mixed oak forest and alder (Boreal); (4) mixed oak forest and hazel stage—maximum for alder, culmination of linden, secondary increase of hazel, entrance of beech and a little later of hornbeam, rational boundary of beech pollen, falling of the hazel curve (Atlantic); and (5) beech period—maximum of hornbeam and beech, secondary increase of pine in the most recent portion (Subboreal and subatlantic).—*G. B. Rigg.*

18266. KUJALA, VILJO. Beobachtungen über die Waldvegetation auf Lehmboden bei Mustila in Elimäki (Süd-Finnland). [Forest vegetation on loam soils near Mustila in Elimäki, southern Finland.] *Metsatieteellisen Tutkimuslaitoksen Julkaisuja* 13: 3-16. 1929.

18267. LEACH, W. The vegetation of the Longmyde. *Jour. Ecol.* 19(1): 34-45. 7 fig. 1931.—A description is given of the vegetation of a hill area in Shropshire, England, where the 2 main communities are oak forest, with *Quercus robur* on the better and *Q. sessiliflora* on the drier, shallower soils; and a heath dominated by *Calluna.* In spots the forest has been replaced by bracken, *Pteris aquilina,* and by grassland.—*G. D. Fuller.*

18268. PALLMAN, H. Zusammenhang zwischen der aktuellen Azidität, dem Gesamthumus und dem Gehalte an dispergierbarem Humus. *Comm. Stat. Internat. Méditerranéenne et Alpine* 9. 1931.—It is not the absolute quantity of organic matter in the soil that determines its acidity but the amount of colloidal humus. A close relationship exists between the dispersed (colloidal) humus and the soil acidity of various plant associations.—*F. R. Bharucha.*

18269. SCHRÖTER, C., (with assistance of C. A. BACKER). Exkursionen in Ost-Java (Idjen-Plateau und Weliran). *Beibl. Vierteljahrschr. Naturforsch. Ges. Zürich* 73(15): 554-600. 3 pl. 7 fig. 1928.—Excursions were made from Pasuruan to the Idjen-Plateau and from Malang to the Weliran volcano, studying the mangrove, the savanna of East Java, caused by the drought of the period of east-monsoon, the secondary rain forest, the *Casuarina* forest, the tussock-grass vegetation of *Themeda gigantea,* the crater and solfatara vegetation, and the "Alpine" vegetation of the summit. In Java there is no true Alpine flora, because the trees reach the highest mountains. A detailed description is given of the climate of the summit of Mount Pangerango.—*C. Schröter.*

18270. STRATMANN, GUSTAV. Der Hümmling. (Beiträge zu seiner Natur und Besiedlung.) *Veröffentl. Naturwiss. Ver. Osnabrück* 21: 169-276. 3 maps, 8 pl. 1928(1929).—In this paper on the glacial geology of the region, discussions are included of the original moor vegetation, succession in interglacial and postglacial periods, climate, and changes in the landscape produced by man.

18271. TURESSON, GØTE. The geographical distribution of the alpine ecotype of some Eurasiatic plants. *Hereditas* 15(3): 329-346. 3 fig. 1931.—Seedling generations of transplant series of *Solidago virgaurea, Bupleurum longifolium,* and *Polygonum bistorta* from the East-Altai Mts. have been grown together with material from the Alps and Carpathians. In Altai, alpine ecotypes of these sp. are found, but not in Europe. The Altai alpine types are higher and somewhat later than the alpine types in Scandinavia. Correspondingly, the Altai lowland ecotypes are taller than the European. The great height of the Altai alpine type is due, therefore, to the fact that it is differentiated out of the very tall lowland Altai type. In order that a sp. may extend into the alpine regions, populations in the lower regions must contain types from which alpine ecotypes may dif-

ferentiate. The lack of alpine ecotypes of these sp. in the Alps and Carpathians is due probably to the fact that the sp. in these areas do not contain such biotypes. The irregular distribution of alpine ecotypes is probably usually due to an irregular distribution of the biotypes necessary for the differentiation of such ecotypes and not to differences in environment in the different alpine regions as often inferred.—*H. Wexelsen.*

18272. WARDLAW, C. W. Observations on the dominance of pteridophytes on some St. Lucia soils. *Jour. Ecol.* 19(1): 60-63. 2 pl. 1931.—On this island of the British West Indies, areas of tropical rain forest had been cut over and reduced to banana plantations, and these plantations abandoned in 1926. In 1929 erosion had caused soil deterioration, and a vegetation quite unlike the original forest was overtopping the few surviving bananas. In this new plant community the tree fern, *Cyathea*, was dominant while the steeper slopes and the faces of road cuttings were covered almost entirely by *Gleichenia*, *Lygodium*, and *Lycopodium cernuum*. In the adjacent undisturbed rain forest, the tree ferns are occasional rather than abundant.—*G. D. Fuller.*

18273. WELCH, WINONA H. Forest and prairie, Benton County, Indiana. *Proc. Indiana Acad. Sci.* 39: 67-72. Map. 1929(1930).—Prior to cultivation there was a prairie type of vegetation, with *Andropogon furcatus* dominating in the uplands and *Spartina michauxiana* in the lowlands. The prairie grasses have now almost disappeared; 8 native groves, which have developed in moist habitats protected from the annual prairie fires, mark the westward extension of the forest into the prairie. A list is given of 56 spp. of woody plants in the groves, which are diminishing on account of pasturing and clearing.

18274. WIINSTEDT, KNUD. Bundvegetationen i Danmarks nordligste bøgeskove. [Underbrush vegetation in northern Danish beech-woods.] *Bot. Tidsskr. [Copenhagen]* 41(2): 81-99. 1930.—Complete lists of plants from the 10 most northern beech-woods of Denmark show that several spp. common in other places are very rare here. Probably some sp. do not occur on account of the bad conditions of the ground; other spp. may not yet have finished their migration towards the north.—*J. Iversen.*

18275. WOULFF, E. Sur l'origine de la flore de la Crimée. *Compt. Rend. Som. Séances Soc. Biogéogr.* 69. 71-77. 1932.—The entire Crimean flora was not derived by migration as many suppose; Crimea possessed an aboriginal flora, part of which survives. Mediterranean spp. (relics of an ancient flora) exist; this suggests an ancient connection between the Crimea and the Mediterranean region. The paucity of endemic spp. indicates that this union was interrupted at a comparatively late geological period; and the richness of the Crimean flora in recent endemics suggests that its insular position is geologically recent. Connections seem to have existed (1) with Asia Minor, and thus with Transcaucasia and the northern part of the Balkan Peninsula; (2) with the northern part of the Balkan Peninsula, via the Dobrudja and the Tarhoukut-Sarytch headlands; and (3) with southern Russia by the Isthmus of Pérékop or by a broader connection. These conclusions are supported by zoology. The Crimea is regarded as a fragment of a mountainous region embracing, in the Pliocene (or later), the central part of the Black Sea and forming a northward continuation of what is today Asia Minor. Probably the Pontic continent was not a plateau, but a chain of parallel ranges, a continuation of the chains which traverse present-day Crimea and form an extension to the mountain chains of Asia Minor. The flora of Crimea and of the eastern part of the Mediterranean formed a unity, but, being in the northern limits of its diffusion, Crimea is relatively poor in these spp. This continent was united, throughout its geological history, with southern Russia, via Dobrudja and the region of the Sea of Azof, and this union persisted until the Pliocene. Migration and spp. formation took place during this union. Towards the end of the Tertiary and at the beginning of the Quaternary, the central part of this continent sank, leaving the Crimea geographically a peninsula and biologically an island.

18276. WRIGHT, ALBERT HAZEN, and ANNA ALLEN WRIGHT. The habitats and composition of the vegetation of Okefinokee Swamp, Georgia. *Ecol. Monogr.* 2(2): 109-123. 74 fig. 1932.—The Okefinokee swamp in southeastern Georgia is in the Sabalian or Lower Austral life zone or alluvial lower county. The region is 102-150 ft. above sea level. The non-frost season is 186-307 days; highest temp. is 85-106°, and lowest, 40-58° F. Local habitat terms and their present-day equivalents and previous classifications are explained. 2,000 sheets of plants were collected with habitat data. Each habitat treatment consists of: ecologic synonymy (1737-1860); discussion; journal notes; and lists of plants, catalogued as trees, shrubs, vines, ferns, grasses, and herbs. The local common names are generally given. The habitats considered are: shallow marshes or prairies; open lakes; wooded swamps or cypress bays; cypress heads; cypress ponds; runs; water-courses; branch swamps; river swamps; rich woods; hammocks; old fields; cleared and cultivated fields, roadsides and railroads; moist pine barrens; savannas; intermediate pine barrens; dry pine barrens; sand scrub; sand hills and ridges; marginal bogs; fern bogs; Sugar House; and Camp Cornelia.

PLANKTON

18277. AKEHURST, S. C. Observations on pond life, with special reference to the possible causation of swarming of phytoplankton. *Jour. Roy. Microscop. Soc.* 51 (3): 237-265. 7 fig. 1931.—The phytoplankton are divided into 2 main groups according to food reserves, roughly starch and oil, and an association between them, is demonstrated. A succession of genera is shown of the same, and between different, classes in the oil and starch groups, due to action and interaction—inhibition and stimulation of growth—by autotoxins (excretion products). Toxic effects do not occur between an "oil" and a "starch." Swarming (increase and decrease) of genera of the 2 groups is due to the available quantity of the accessory food. The toxin of the oil group becomes an accessory food of the starch group, and conversely. Inhibition by autotoxin is necessary to avoid the tendency towards permanent supremacy of the dominants in each of the classes. While maintenance of chemical (essential foods) and physical conditions is necessary to allow normal algal development, swarming of the phytoplankton is due to the available quantity of accessory foods. The exchange of excretion products is maintained at all temp. within limits possible for algal growth on stones, land, and in water. At depths beyond the illuminated areas the non-motile algae, Bacillariales and Myxophyceae, and some Isokontae, may continue their activities by changing the method of nutrition from that of holophytes to saprophytes after the manner of the subterranean algae. Variation of oxidation of accessory food reduces or increases swarming. Oxidation is definite in fast-running, less so in moderately-moving, and absent in calm waters; the swarming of phytoplankton is also governed by the prevalence of these conditions.—*Author's summary.*

18278. ALSTERBERG, GUSTAF. Über das aktuelle und absolute O_2-Defizit der Seen im Sommer. *Bot. Notiser* 1929(5/6): 354-376. 3 fig. 1929.—The usual method of computing the excess or deficiency of dissolved O at different depths in lakes is to compare the amount actually found at the various depths with the quantity required to saturate the water at the observed temp. Here a 2nd method is proposed, viz., the absolute deficit, which is the deficit based upon the amount of O required to saturate a liter of water at 4° C. at sea level.—*C. Juday.*

18279. ANCONA, U. d', e LUISA VOLTERRA-d'ANCONA. Osservazioni preliminari sulle modificazioni idrobiologiche avvenute nel Lago di Nemi durante e in seguito ai lavori di abbassamento esseguiti per il ricupero

delle navi Romane. [Hydrobiological modifications due to lowering the level of Lake Nemi (Italy)]. *Atti R. Accad. Naz. Lincei Rend. Cl. Sci. Fis. Mat. e Nat.* 13(3): 217-223. 1931.—The lowering of the lake level by 15 m. has exposed more shelving shores than before. These have become overgrown by abundant littoral vegetation, consisting chiefly of *Myriophyllum spicatum* mixed with *Lemna*. Organic material abounds near the edge and the conditions in the lake have changed from an oligotrophic to an almost eutrophic type. An observable increase in the phyto- and zoo-plankton and modifications in the constitution of the latter are possibly due to this change. *Daphnia cucullata*, artificially introduced in 1914, has become even more abundant than the indigenous *D. longispina*.—*U. d'Ancona (transl. by P. M. Jenkin)*.

18280. ATKINS, W. R. G. Seasonal variations in the phosphate and silicate content of sea-water in relation to the phytoplankton crop. V. November 1927 to April 1929, compared with earlier years from 1923. *Jour. Marine Biol. Assoc. Unit. Kingdom* 16(3): 821-852. 12 fig. 1930.—The phosphate content of sea water at Station E1 in the English Channel off Plymouth varies from 48 mgm. P_2O_5 per m.^{3} down to 0 mgm. For the whole water column surface to 70 m. maximum values during the last yrs. were 36 mgm. in winter, the minimum value for the column being 8 mgm. in June. For the 7 yrs. the maximum for the whole column was 37 mgm. and the lowest maximum 31 mgm. The absolute minimum for the water column was 5 mgm. in Aug. 1925. The surface as well as the deeper water may act as a region of phosphate regeneration. As much as 6 or 7 weeks' difference may occur in the date of the spring diatom outburst. Differences in the seasonal productivity of the various yrs. was marked. Phytoplankton production, as measured by phosphate consumption, proceeds by a series of outbursts. There is general agreement between the curve for seasonal variation in phosphates and silicates but the latter never reaches zero. The July minimum was about 33 mgm. of silica per m.^{3} which is very near the detectable limit. The winter maxima (320-220 mgm.) appear to differ more than the phosphate maxima. In April 1929 a sudden fall in phosphate concentration was accompanied by a remarkably rich phytoplankton outburst. Every sample of water bottled from 0 to 70 m. contained lumps of *Phaeocystis*, as well as the diatom *Lauderia borealis* in abundance. *Rhizosolenia stolterfothii, chaetoceros, decipiens*, and *Nitzschia delicatissima* were plentiful; 12 other sp. of diatoms were found, and 4 peridinians. The productivity order of the yrs. is in general the order of spring sunshine. The variations in the clearness of the water also affect submarine illumination. Such variation may cause an 8-fold variation in the upper 20 m., much the same as is found between winter and spring.—*W. R. G. Atkins.*

18281. BACHMANN, H. Hydrobiologische Untersuchungen am Rotsee. *Zeitschr. Hydrologie* 5(3/4): 39-81. 8 pl. 1931.—This Swiss lake is decidedly eutrophic, i.e., it is rich in dissolved substances and is correspondingly rich in phytoplankton. This condition is caused by drainage and sewage from Lucerne. The constant change of chemical conditions results in a constant change of the phytoplankton. The most abundant spp. of phytoplankton, forming water bloom, are lacking or at least very rare in the other Swiss lakes. This lake exhibits a typical stratification of the plankton, the seasonal and vertical distributions of which are tabulated.—*From author's summary.*

18282. BALDENSPERGER, AUGUSTE. La faune et la flore planctonique des étangs du Hautrhin et des régions voisines. III. Notes hydrobiologiques d'après les pêches faites en 1927 et 1928. *Bull. Soc. Hist. Nat. Colmar* 21: 169-296. 6 pl. 1929.—A list is given of the phyto- and zoo-plankton found in 51 localities 1927-1928. The plates show the seasonal variations in form of some of the organisms.—*C. Juday.*

18283. BALDI, EDGARDO. Prime ricerche sulla fauna del lago del Piano (Val Menaggina). [Fauna of Lake Piano.] *Arch. Zool. Ital.* 15: 97-125. 6 fig. 1931.—This lake basin may be the relict of an oriental quaternary arm of Lake Lugano. Notes are given on the temp. of the waters. The zooplankton totals about 130 Entomostraca and Rotifera per liter. The study of the distribution reveals the influence of the frozen crust on the plankton distribution. Study is reported of some forms of Entomostraca, especially of *Leptodora, Daphnia*, and *Bosmina*, the representatives of which show some interesting characters of adaptation to particular conditions of the relict basin.—*E. Baldi.*

18284. [BERG, L. S.] БЕРГ, Л. С. Гидрологические исследования на Иссык-куле в 1928 году. [Hydrological investigations in Lake Issyk-Kul' (Turkestan) in 1928.] Известия Государственного Гидрологического Института (*Bull. Inst. Hydrol.*) 1930(28): 9-24. Map, 1 fig. 1930.—Plankton of the pelagic part is poor in number of spp. (7) and Cladocera are totally absent. Five more spp. are found in littoral waters. *Peridinium borgei* is abundant in fresh-water coves in the eastern part of the lake. The presence of *Hydrobia ventrosa*, a European sp., is a riddle. A list of 11 spp. of fishes is given.

18285. BOSSOLASCO, MARIO. Questioni fotogrammetriche di aerolimnologia. *Internat. Rev. Ges. Hydrobiol. u. Hydrograph.* 25(5/6): 333-341. 4 pl. 1931.—This is principally a discussion of the extended range of application of aerial photographic methods in limnology, with notes on the practical accomplishment of such surveys. The advantage, if not the necessity, of perpendicular photographs in the lake district is pointed out, and the significance of terrestrial refraction in light is discussed.—*C. Juday.*

18286. BRUNELLI, G. L'eutrofismo da stagnazione nei laghi artificiali. *Atti R. Accad. Naz. Lincei Rend. Cl. Sci. Fis Mat. e Nat.* 11(5): 495-497. 1930.—A general account is given of the eutrophic conditions in 2 artificial lakes. *Microcystis* was the dominant plankton organism in one and *Ceratium* in the other, with *Anabaena* and *Melosira* of 2nd importance.—*C. Juday.*

18287. GOTTSCHALL, RUSSELL Y. Preliminary report on the phytoplankton and pollution in Presque Isle Bay, Lake Erie. *Proc. Pennsylvania Acad. Sci.* 4: 69-79. 3 maps, 1 fig. 1930.—The phytoplankton of Presque Isle Bay and the waters of Lake Erie just outside is very abundant, both as to genera and numbers. The lowest number was 30,000 per liter in July; this is sufficient to support a very large fish population. These waters are contaminated with sewage from the city of Erie. The lowest number of bacteria per cc. was 60, the highest 150,000. No evidence of anaerobic respiration has been found, or an O content so low that it would not support life. The lowest O content was 41% of saturation in Sept.; the highest, complete saturation, in Jan.—*Author's conclusions.*

18303. **WAWRZYNIAK, FRANCISZEK. Mifroflora denna Jeziora Lednicy. [Phytobenthos of Lake Lednica, Poland.]** [With German summary.] *Kosmos [Lwów]* 55 (3/4): 712-722. 1930(1931).—Forms of phytobenthos found in this lake (listed) include 2 Schizomycetes, 13 Schizophyceae, 19 Chlorophyceae, 9 Conjugatae, 2 Flagellatae, 2 Peridinieae, and 111 Bacillarieae. The predominant sp. are *Tabellaria fenestrata* var. *asterionelloides, Chroococcus limneticus* var. *distans,* and *Staurastrum polymorphum.*

18304. **WORTHINGTON, E. B. Vertical movements of fresh-water macroplankton.** *Internat. Rev. Ges. Hydrobiol. u. Hydrograph.* 25(5/6): 394-436. 8 fig. 1931.—Work was carried out by means of vertically hauled closing nets on the Victoria Nyanza and Lake Lucerne in order to test the hypotheses of F. S. Russell with regard to the vertical plankton movements in the English Channel. In Lake Lucerne the total depth (105 m.) was divided into 8 stages and series of hauls were repeated at hourly intervals for 26 hrs. Most sp. start their descent at dawn and reach their lowest level (50-60 m.) before noon. Then the slow upward movement starts, accelerates at dusk, and continues for 2-3 hrs. after complete darkness. There is a difference between the behaviour of young and old individuals of certain sp., showing that in growing up the individuals become less susceptible to light and so can remain longer at the surface. The speed of descent and ascent was calculated for each sp.: the young of *Daphnia longispina* were quickest with a descent of 1 m. in 3.1 min. and ascent of 1 m. in 4-3 sec. The migrations of the Victoria Nyanza are much the same as those of Lake Lucerne. The results do not fall in altogether with Russell's suggestion that each sp. has an optimum degree of illumination in which it will stay when possible, and to which it will migrate. An alternative hypothesis is suggested, depending on the simple interaction of geotropism and heliotropism, the organisms being regarded as under the influence of these 2 forces. Those sp. which are susceptible to light descend into the lower layers during the morning; after mid-day they are free to move upward slowly, but it is not until dusk that negative geotropism has full sway and the organisms start their main upward movement. Most sp. are filter feeders depending on the nanno-plankton which is must abundant in the upper layers. It is suggested therefore that hunger is the ulterior reason why they seek the upper layers. Thus those spp. which are less susceptible to light such as *Diaphanosoma* and the adults of *Bosmina* have an advantage in that they can spend much more of their time in their food regions.—*E. B. Worthington.*

DISEASES CAUSED BY FUNGI

18305. **[BAUM-CHUMAKOVA, E.]** БАУМ-ЧУМАКОВА, Е. Горькая гниль яблок, вызываемая Glomerella cingulata. **[Bitter rot of apples (G. cingulata).]** [With English summary.] Болезни Растений [*Bolezni Rastenii*] 19(1/2): 55-69. 1930.—Brief report of the distribution and economic importance of this fungus in USSR.

18306. **BONNE, KURT. Untersuchungen über den Steinbrand des Weizens.** *Angewandte Bot.* 13(3): 169-208. 4 fig. 1931.—The author holds that in bunt experiments, the use of the standard deviation is not warranted because fluctuations may not be chance, but systematic, errors; the latter are not measured by the standard deviation. Hot-air and hot-water treatment of wheat seed delayed germination, and in seed inoculated after treatment the percentage of bunt in the crop was less than in inoculated but otherwise untreated seeds. No relationship could be detected between speed of growth of resistant and susceptible varieties and the reaction to bunt. Collections of bunt from different sources differed in pathogenicity on spring and winter wheats, but equally marked were differences induced by bunt from different varieties which had been inoculated with the same original collection.—*W. K. Smith.*

The isolation of the pathogen in pure culture, inoculation to establish its pathogenicity, and salient points in its

Notes on the abundance of 30 kinds of galls on 3 local oaks.—*L. H. Weld.*

18324. ROSS, J. The gall of Andricus seminationis. *London Naturalist* 1930: 137-138. 1931.—In Epping Forest in 1929 and 1930, fresh galls on catkins appeared over a period of 5 mo. Dry weather seemed to retard their appearance and growth.—*L. H. Weld.*

18325. TRIFFITT, MARJORIE J. Observations on the life-cycle of Heterodera schachtii. *Jour. Helminthol.* 8 (4): 185-196. 1930.—Early in the year 8-9 weeks were required for the formation of brown cysts on potato roots, less than 6 towards the end. After August all females on exposure to light turned brown in 24 hr., in May-June in 1-7 days. Results were confirmed by a strain on mangolds. Observations on both showed that larvae were produced only from brown cysts; experiments and observations showed that normally only 1 generation is produced each yr. Progressive liberation of larvae from soil cysts may result in successive infections. Root excretion is necessary for hatching. Eggs in overwintered cysts are capable of hatching the following yr.—*F. J. Meggitt.*

18326. TRIFFITT, MARJORIE J. On the pathogenicity of Heterodera schachtii to potatoes and mangolds. *Jour. Helminthol.* 9(1): 1-16. 2 pl., 4 fig. 1931.—The effect, as shown by 3 yr. observations on artificially infected plots, is more marked on mangolds than on potatoes, due to the less extensive root system. Experiments proved that, in the early stages, parasitised potatoes weigh considerably less than normal. Transpiration is hindered in the mangold but in the potato is unchecked owing to the addition of lateral roots. Root secretions have no pathogenic effect on the growth of potatoes. Internally the attack in potatoes and mangolds causes the formation from parenchymatous cells of giant multinucleate syncytia which spread into the interior and, coalescing, block the vascular bundles and considerably reduce their efficiency, the result being more marked in mangolds. In both healthy and attacked tissues of parasitised potatoes occurs an undetermined species of fungus. Probably other factors are responsible for the production of disease symptoms in the presence of *H. schachtii,* operating by producing conditions unsuitable for plant growth, thus checking the output of compensatory roots and preventing the plant from recovering from the original effects of the eelworm attack.—*F. J. Meggitt.*

18327. TRIFFITT, MARJORIE J. Note on a fungus parasite associated with Heterodera schachtii infections on potatoes. *Jour. Helminthol.* 9(2): 47-48. 1931.—*Colletotrichum atramentarium* is recorded as being associated with "potato sickness."—*F. J. Meggitt.*

18328. TRIFFITT, MARJORIE J. On the eelworm Heterodera schachtii attacking peas in Britain. *Jour. Helminthol.* 9(3): 175-178. 1931.—Peas were found infested by this nema near Cardiff, Worcester, and Evesham. The plants were also attacked by *Fusarium martii* var. *pisi.*—*F. J. Meggitt.*

18329. ULBRICH, E. Bericht über die Frühjahrshauptversammlung des botanischen Vereins, am 1. und 2. Juni 1929 in Eberswalde. *Verhandl. Bot. Ver. Prov. Brandenburg* 72(2): 140-146. 1930.—This report contains a list of plant galls collected.

DISEASE RESISTANCE AND PARASITISM

18330. DIETZ, S. M. The varietal response and inheritance of resistance in barley to Erysiphe graminis hordei P. F. 4. *Iowa State Coll. Jour. Sci.* 5(1): 25-33. 1 pl. 1930.—The response of 90 pure line varieties of barley was determined. Goldfoil C.I. 928, Unnamed C.I. 96, Hanna C.I. 906 and Duplex C.I. 2433 were highly resistant. 44 varieties were very susceptible, and the other 42 intermediate. Susceptibility seems to be due to a single pair of factors as shown by the close approximation to a 3:1 ratio in the F_2 and verified by the F_3 progeny tests.—*Author's summary.*

18331. DUFRÉNOY, J. La lutte contre la maladie des châtaigniers. *Ann. Épiphyties* 16(1): 25-49. Map, 5 pl., 15 fig. 1930.—Control of the ink disease of chestnut, caused by *Blepharospora (Phytophthora) cambivora,* is best achieved by the introduction of resistant Japanese varieties of *Castanea crenata* and *C. mollissima.* The fungus is unable to become established in these species, quickly dying out after being walled off by callus. Resistance may be due to the presence within the walls of toxic phenolic compounds which the resistant species produce.—*L. J. Klotz.*

18332. DUFRENOY, JEAN, et TH. FRÉMONT. Influence de la température sur les réactions du maïs à l'infection fusarienne. *Phytopath. Zeitschr.* 4(1): 37-41. 5 fig. 1931.—Infection experiments on maize were made with *Fusarium graminearum (Gibberella saubinetii)* in chambers at 7° and 20°C. At 7° the plants are rapidly attacked. The cells of the leaves or leaf sheaths surrounded by the fungus live for some time but the cytoplasm (normally forming a continuous envelope around a large central vacuole) becomes spongy, forming cytoplasmic strands that divide the vacuole into many smaller vacuoles. This densely vacuolar region near the nucleus takes stains with great intensity and is homologous with the "inclusion bodies" of mosaic diseases. No phenolic compounds are formed at this temp. either in the cells affected by the fungus or the neighboring cells. At 20° the fungus is not able to penetrate. Where the fungus attempts such a penetration, the vacuole of the host cell divides into fragments; but in this case phenolic compounds, which are precipitated by some stains and fixers, accumulate in one vacuole. This accumulation of phenolic compounds is believed to be a fundamental phenomenon in disease resistance. The development of lignified thickenings of the walls of certain cells is regarded as an epiphenomenon. The presence of phenolic compounds has been found in potatoes resistant to *Phytophthora infestans,* in chestnuts resistant to *P. cambivora,* and beans resistant to *Colletotrichum lindemuthianum,* but absent in susceptible beans. Phenolic compounds are found also in cells surrounding the lesion on plants which show localized parasitic infection.—*F. M. Blodgett.*

18333. McCLINTOCK, J. A. The source of apple seed in relation to pests on seedlings. *Proc. Amer. Soc. Hort. Sci.* 27: 120-123. 1930(1931).—Seedlings of many American cultivated varieties, as well as cider varieties from France, Italy, and Germany, are resistant to cedar-rust but are rather susceptible to blotch, fire blight, apple leafhopper, and woolly aphis. Seedlings of native wild southern crab apples are very susceptible to cedar rust, but resistant to blotch, fire blight and leafhopper and are immune to woolly aphis. Seedlings of *Pyrus baccata* and other cultivated crabs are resistant to cedar rust, but are intermediate between cultivated and native crabs in their resistance to other pests.—*Author's abstract.*

18334. [SUKHORUKOV, K.] СУХОРУКОВ, К. Энзиматическая активность растительного организма и некоторые явления физиологического иммунитета. [Enzymatic activity of the vegetative organism and some phenomena of physiological immunity.] [English summary.] Журнал Опытной Агрономии Юго-Востока (*Jour. Agric. Sci. S. E. U. S. S. R.*) 8(2): 237-266. 1930.—A study was made of the internal condition in *Helianthus, Artemisia,* and *Xanthium* in various stages of disease. It was found that immunity to rust in the sunflower is closely associated with the activity of peroxidase. The immune form showed a lower enzymic activity. Other enzymes, such as catalase and proteases, apparently play a very minor rôle in the immunization of plants. The activity of proteases is higher in the parasite than in the tissues of the host.—*L. J. Pessin.*

DISEASE CONTROL (SEED TREATMENT, SOIL DISINFECTION, FUNGICIDES AND SPRAYING)

18364. [KRASSOVSKAĬA, I. V.] КРАСОВСКАЯ, И. В. Влияние реакции среды на поглощение воды и солей табаком в водных культурах. [Absorption of water and salts by the tobacco plant in relation to pH.] Труды Детскосельской Акклиматизационной Станции при Ленинградском Сельско-Хозяйственном Институте (*Bull. Sta. Acclim. Leningrad Agric. Inst. Detskoe Selo*) 4: 31-54. 1927.—The plants were cultivated at pH 5.5-8.7. The reaction of the solution was measured by the H ion electrode and colorimetrically; and the solutions were changed every 2-4 days. The absorption of salts (measured by the Kohlrausch method of electrical conductivity) was highest in the acid solutions, lowest in the alkaline, with the neutral solution intermediate. When plants were transferred to an alkaline medium the decrease in absorption preceded the decrease in growth rate of the leaf area. The differences in the influence of different reactions on the absorption of salts disappeared gradually with the period of flowering, and at this time there might even occur a certain increase in absorption of salts and rate of growth in alkaline solutions in comparison with plants grown in acid solutions. No quantitative or qualitative difference could be observed in the effect of the 2 acid reactions (pH=5.5 and 6.1) or of the 2 alkaline ones (pH=7.8 and 8.7). The intensity or rate of water absorption (or transpiration) was highest with acid reaction, lowest with alkaline. The differences were greatest at the time of the most energetic growth. At the period of flowering these differences disappeared, just as with the process of salt absorption. The plants from the acid solutions gave the highest yield; those from the neutral, the lowest.—*From author's summary.*

18365. **LEPESCHKIN, W. W. Light and the permeability of protoplasm.** *Amer. Jour. Bot.* 17(10): 953-970. 1930.—Results of earlier experiments showing that the permeability of protoplasm increases in light and decreases in the dark were confirmed. The rate of accumulation of aniline dye in the cell sap was employed as a measure of relative permeability, using as experimental material entire leaves of *Elodoea densa* and *E. canadensis*, which were immersed in the dye solution for limited periods. For comparison of tints developed by the test leaves, a standard set of leaves taken from the same plant and subjected to treatment for various periods was used. The effect of light on absorption of dyes is due to its action in increasing permeability. The absorptive power of the cell sap and the adsorption of dye on the cell wall or in dead protoplasm are not affected by light. The effect of light on permeability is strictly limited to the illuminated plant parts. Change in permeability is conditioned by the amount of the light energy and not by the manner in which the energy is received by the plant. In direct sunlight the maximal influence on permeability can be obtained with 10% of the full intensity, and further increase in intensity is without definite effect. Ultraviolet rays are most active and violet, blue, green, and red rays progressively less active in influencing permeability.—*W. W. Garner.*

18366. **MAGISTRIS, HUGO, und PAUL SCHÄFER. Zur Biochemie und Physiologie organischer Phosphorverbindungen in Pflanze und Tier. V. Über die Beeinflussung des Austrittes von wasserlöslichen Pflanzenphosphatiden durch Licht und Temperatur. VI. Über die Beeinflussung des Austrittes von wasserlöslichen Pflanzenphosphatiden durch Salze, Säuren und Alkalien.** *Beitr. Biol. Pflanzen* 18(1): 116-160. 1930.—The effect of light, temp., salts, acids, and bases upon the rate at which organically-bound P compounds diffuse from plant tissue into the surrounding liquid was determined. When pea seed or disks of tissue from peeled turnips were sterilized and covered with a layer of distilled water in a shallow dish the rate at which organic P diffused into the liquid was greater in light than in darkness. Two sources of illumination were used: 600-watt light (at 20 cm.) and a quartz lamp (at 40 cm.). With tissue which was illuminated first and then placed in darkness the exosmosis was greater than with non-illuminated tissue, but the differences became progressively smaller with time. Increase in temp. increased the rate at which P diffused from the tissue. For the salt-effect, peas, beans, oats, rutabaga, and beets were used at concentrations of $N/1$, $N/50$, and $N/100$. Mg^{++} and ions of the alkali series favored, while ions of the alkaline earths retarded, exosmosis of P compounds. For the anions the order of effectiveness for increasing exosmosis was: nitrate, chloride, bromide and iodide, acetate and thiocyanate, citrate, tartrate. Exosmosis was always greater in solutions of acids and bases than in water.—*F. E. Denny.*

18367. [WALTHER, O. A.] ВАЛЬТЕР, О. А. Почему мы изучаем отношение культурного растения к истинной реакции среды. [Why do we study the influence of pH on cultivated plants?] Труды Детско-Сельской Акклиматизационной Станции при Ленинградском Сельско-Хозяйственном Институте (*Bull. Sta. Acclim. Leningrad Agric. Inst. Detskoe Selo*) 4: 1-10. 6 fig. 1927.—This is a brief outline of some recent publications on the agricultural value of pH-studies and of the principal problems investigated by the Physiological Section of the Station for Plant Acclimatisation 1923-1926.

WATER RELATIONS, SAP MOVEMENT

18368. **CLEMENTS, HARRY F. The upward movement of inorganic solutes in plants.** *Res. Studies State Coll. Washington* 2(3): 91-106. 1 pl., 4 fig. 1930.—Chemical and anatomical studies are reported on translocation activities of *Vitis vinifera*, *Rubus occidentalis*, *R. idaeus* var. *strigosus* (Cuthbert), *R. neglectus* (Columbian), *Pyrus malus*, *Prunus americana*, and *P. persica*. When the stems of the grape, raspberries, and plum were girdled to the xylem, the upward movement of ash constituents and nitrates continued, indicating that the major movement of mineral materials moving upward in the plant took place in the xylem. The conclusions of Curtis and Auchter are criticized.—*H. F. Clements.*

18369. **DASTUR, R. H. The relation between water content and photosynthesis: a reply to a criticism.** *Jour. Indian Bot. Soc.* 6(3/4): 222-225. 1927.—The author defends his use of surface area instead of thickness of leaves in calculating water content, because variations in thickness were well within the margin of experimental error; also the inclusion of water of imbibition in calculating water content, for it is at least of indirect importance in photosynthesis. Recalculation of results shows that even when correction is made for water of imbibition, the author's original conclusions regarding the relation between water content and rate of photosynthesis are sustained (except in 3 cases).—*W. Dudgeon.*

18370. **INAMDAR, R. S., and B. M. DABRAL. Experiments on transpiration. I. The daily water balance of plants in arid regions.** *Jour. Indian Bot. Soc.* 9(1): 1-30. 5 fig. 1930.—Actual transpiration was compared with evaporation from a free water surface at Benares in May and June, the hottest and driest period of the yr. Experiments are recorded in detail for *Ficus elastica*, *Gossypium herbaceum*, and *Jasminum* sp. Concordant results were obtained, but are not reported in detail, for *Aralia* sp., *Codiaeum* sp., *Acalypha* sp., *Ficus religiosa*, and *Bryophyllum*. *F. elastica* and *Gossypium* showed practically constant rates of loss on different days, in spite of considerable fluctuation in evaporating capacity of the air. *Jasminum* plants showed similar constancy, when exposed to full sunlight or kept in shade, and when exposed for successive periods to sunlight and returned to shade after each exposure. When exposed to progressively severe evaporating conditions on successive days, they reached their maximum daily transpiration rate when the evaporating power of the air was about 37% of the maximum evaporating power of full sunlight; further increase in evaporating capacity of the atmosphere produced little or no increase in transpirational water loss. It is concluded that "the daily loss of water per unit area of evaporating surface (of the plant) re-

the mother's mouth, with its tail, hind legs and fore paws curled about the neck of the mother."—*L. R. Dice.*
